XX New isolated polynucleotides comprising single nucleotide polymorphisms
XX of the cardiovascular gene, useful for assessing predisposition or
XX susceptibility to a cardiovascular disease, e.g. atherosclerosis,
XX restenosis or stroke.
XX
XX Disclosure; Page 81; 187pp; English.
XX
XX The invention relates an isolated polynucleotide (I) encoded by a
XX cardiovascular associated (CA) gene, having allelic variation contained
XX in a functional surrounding like full length cDNA for CA gene
XX polypeptide, and with or without the CA gene promoter sequence. (I) is a
XX polynucleotide comprising single nucleotide polymorphisms predicting
XX cardiovascular disease. The polynucleotides are useful for assessing
XX predisposition or susceptibility to a cardiovascular disease, e.g.
XX atherosclerosis, ischemia/reperfusion, hypertension, restenosis, arterial
XX inflammation, myocardial infarction, and stroke. These may also be used
XX to predict personal medication schemes omitting adverse drug reactions,
XX or as probes for detecting genetic polymorphisms and as templates for the
XX recombinant production of normal or variant peptides/polypeptides encoded
XX by the genes. This sequence corresponds to a PCR primer to amplify one of
XX the genes of the invention.

XX XX New antisense oligonucleotides targeted to a nucleic acid encoding liver
XX PT related homologue-1 (LRH1), useful for treating breast cancer.
XX PT dyslipidaemia, atherosclerosis, hypercholesterolemia, or hepatitis.
XX PS Example 15; SEQ ID NO 868; 909pp; English.
XX CC This invention relates to novel antisense compounds useful for modulating
XX CC the expression of liver related homologue-1 (LRH1) and splice variants
XX CC thereof. Specifically, it refers to compositions 8-30 nucleobases in
XX CC length that target a portion of an active site on the nucleic acid
XX CC molecule encoding LRH1 (also known as NR5A2). LRH1 is a monomeric orphan
XX CC nuclear receptor protein that functions as a tissue specific
XX CC transcription factor. The present invention describes antisense
XX CC oligonucleotides that comprise at least one modified internucleoside
XX CC linkage, a phosphorothioate linkage, at least one modified sugar moiety,
XX CC a 2'-O-methoxyethyl (2' MOE) and at least one modified nucleobase, a 5-
XX CC methylcytidine. These antisense compounds are useful for treating or
XX CC diagnosing a disease associated with LRH1, such as breast cancer,
XX CC dyslipidaemia, atherosclerosis, low HDL (high density lipoprotein), high
XX CC LDL (low density lipoprotein), hypercholesterolemia, gall stone,
XX CC triglyceridaemia, obesity, hepatitis B virus-mediated acute or chronic
XX CC hepatitis, as well as hepatocellular carcinoma or a condition associated
XX CC with aromatase activity. Accordingly, these compositions exhibit
XX CC cytosolic, antipneumatic, antiarteriosclerotic, anorectic, hepatotropic,
XX CC litholytic, antiinflammatory and virucidal activities. This
XX CC oligonucleotide sequence is an antisense DNA oligo used to modulate the
XX CC expression of the human LRH1 protein of the invention.

 PT Interference RNA agent useful for treating dyslipidaemias, coronary artery  
 PT disease, diabetes, cancer or neurological disease, comprises sense  
 PT sequence and antisense sequence which has specific modifications.  
 XX  
 PS Example 5; SEQ ID NO 51; 378bp; English.  
 XX  
 CC The invention describes a RNA interference (iRNA) agent (i) comprising a  
 CC sense sequence and an antisense sequence, where the sense sequences have  
 CC one or more asymmetrical 2'-O-alkyl modifications, the antisense  
 CC sequences have one or more asymmetrical phosphorothioate modifications  
 CC and the antisense sequence targets a human gene sequence. Also described  
 CC are: a pharmaceutical preparation comprising (i); reducing (M1) apoB-100  
 CC levels or glucose-6-phosphatase levels in a subject; producing (i);  
 CC stabilising (i), involves selecting a sequence with activity and  
 CC introducing one or more asymmetrical modification in the sequence, where  
 CC the modification decreases nuclease sensitivity while not decreasing its  
 CC activity; a kit comprising (i) and instructions for its use; and a device  
 CC that can be dispense or administer a composition comprising (i). (i) is  
 CC useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M1)  
 CC is useful for reducing apoB-100 levels or glucose-6-phosphatase levels.  
 CC The subject is suffering from a disorder characterised by elevated or  
 CC otherwise unwanted expression of apoB-100, elevated or otherwise unwanted  
 CC levels of cholesterol, and/or dysregulation of lipid metabolism. The  
 CC disorder is chosen from the HDL/LDL cholesterol imbalance.  
 CC dyslipidaemias, hypercholesterolaemia, statin-resistant  
 CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart  
 CC disease (CHD) and atherosclerosis. (i) is administered to a subject to  
 CC inhibit hepatic glucose production or for treating glucose-metabolism-  
 CC related disorder e.g. diabetes or type-2 diabetes. (i) is useful for  
 CC treating the diseases as mentioned above, cancer (e.g. breast, colon or  
 CC lung cancer), neurological disease (e.g., Huntington disease or  
 CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence  
 CC represents a human apolipoprotein B (ApoB) antisense oligonucleotide that  
 CC can be used to control ApoB gene expression.

 CC This inside PCR primer is used in fusion PCR, working in combination with  
 CC an outside PCR primer to amplify a target nucleic acid sequence, in this  
 CC case the CH3 region of human IgG1 to amplify the entire heavy chain human  
 CC chain variable region. The fusion PCR reaction is used to produce two  
 CC fragments with cohesive termini, which when mixed hybridise to form an  
 CC overlapping DNA duplex that is internally primed. Subsequent PCR extends  
 CC the non-overlapping region to form a hybrid DNA mol. that is dicertronic  
 CC contg. a first polypeptide coding sequence and a second polypeptide  
 CC coding sequence linked by a dicertronic bridge. This method thus allows  
 CC fusion of heavy and light chains prior to vector ligation, avoiding the  
 CC cumbersome separate cloning of fragments. (Updated on 25-MAR-2003 to  
 CC correct PN field.)

 PS  
 XX  
 CC Primers (AAQ78917-38) were used to PCR amplify and clone the human  
 CC immunoglobulin variable heavy chain genes (AAQ78939-79002). The genes  
 CC were isolated from a series of cosmid constructs: Y202; Y103; Y21; Y6; Y24  
 CC 3-31; M84; M18 and M31. The genes are subdivided into 5 families of  
 CC Vh genes. Primers (AAQ78932-5) were used to amplify the family IV Vh  
 CC genes. The fragments cover a region of 800 kb. The DNA fragments were  
 CC isolated from high molecular weight DNA from human placenta. The DNA was  
 CC partially digested with TaqI restriction enzyme. The fragments were  
 CC separated by gel electrophoresis and 35-45 kb fractions were collected.  
 CC The fragments were ligated with ClaI-digested cosmid vector pJB81. The  
 CC ligation products were in vitro packed and infected into E.coli 490A. The  
 CC fragments were then subcloned by colony hybridisation. The Vh genes and  
 CC the DNA fragments encoding them are useful in producing human  
 CC immunoglobulin in mammalian hosts. (Updated on 25-MAR-2003 to correct PN  
 CC field.)

 CC This invention describes a novel method for the detection and/or typing  
 CC of Helicobacter pylori strains present in a sample using PCR primers and  
 CC probes to detect regions of the vacuolating toxin (vacA) gene and other  
 CC virulence determinant genes (VDG) e.g. the cytotoxin-associated (cagA)  
 CC gene. The method allows the typing and allele-specific detection of a  
 CC strain according to the VDG alleles present in that particular H. pylori  
 CC strain. The virulence determinant genes are the genetic elements involved  
 CC in enabling, determining, and marking the infectivity and/or  
 CC pathogenicity of the H. pylori strain. The method provides a way of  
 CC detecting H. pylori strains in a sample with respect to the development  
 CC of chronic active gastritis, gastric and duodenal ulcers, gastric  
 CC adenocarcinomas, mucosa-associated lymphoid tissue lymphomas, and/or  
 CC determining eradication therapy. AAV73508-V73546 represent PCR primers  
 CC and probes used in the detection of the H. pylori vacA and cagA genes.  
 CC The primers and probes are used especially to detect the vacA S regions  
 CC S1a/b/c and S2 and the M regions M1 and M2 which are represented in  
 CC AAV73547-V73785

 XX Antisense oligonucleotides of the MEK2 kinase gene, useful in diagnostic  
 PT protocols in vitro and for inhibiting the expression of MEK2 in vivo for  
 PT the treatment of human hepatocellular carcinomas and breast carcinomas.  
 PS  
 XX Claim 11; Col 39; 32pp; English.  
 XX  
 CC The present invention describes antisense oligonucleotides (asMEK2) of  
 CC the human MEK2 dual specificity kinase gene. The MEK2 gene (also called  
 CC MAPK2, mpk2, MAPK/ERK kinase 2, pmrk2 and erk activator kinase)  
 CC represents a convergent target for the regulation of a range of cellular  
 CC processes including proliferation, differentiation and development.  
 CC asMEK2 may be used to inhibit the expression of MEK2 genes in vivo and/or  
 CC in vitro. MEK2 has been shown to be over expressed in some tumour cells.  
 CC Therefore, asMEK2 may be administered to a patient to treat  
 CC hepatocellular carcinomas and breast carcinomas. asMEK2 may also be used  
 CC as a diagnostic tool to specifically inhibit the expression of MEK2  
 CC genes. The role of the inhibited genes in cellular pathways may then be  
 CC evaluated. They may also be used as probes to detect sequences encoding  
 CC MEK2 or as primers for the amplification of those sequences. AAZ21406 to  
 CC AAZ21443 represent specifically claimed asMEK2's from the present  
 CC invention

XX PS Example; Page 18; 40pp; English.
XX
CC This sequence represents a PCR primer for the human CYP3A4 gene. The
CC invention relates to a CYP3A4 sequence polymorphism, which is part of a
CC non-naturally occurring chromosome. Nucleic acids comprising the CYP3A4
CC polymorphic sequences can be used to screen patients for altered
CC metabolism for CYP3A4 substrates, potential drug-drug interactions, and
CC adverse/side effects as well as diseases that result from environmental
CC or occupational exposure to toxins. They can also be used to establish
CC animal, cell culture and in vitro cell-free models for drug metabolism.
CC Polymorphic CYP3A4 gene sequences can be used for expression studies to
CC determine the effect of promoter and/or intron sequence variations on
CC mRNA expression and stability. The polymorphisms are also used as single
CC nucleotide polymorphisms to detect genetic linkage to phenotypic
CC variation in activity and expression of CYP3A4. The nucleic acids can
CC also be used to generate genetically modified non-human animals or site
CC specific gene modifications in cell lines

XX The present sequence is one of a large number of antisense

CC oligonucleotides which is directed against one of four human steroid

CC receptor RNA activator (SRA) nucleic acid sequences. Two series of

CC antisense oligonucleotides were synthesised. The first series comprised 8

CC -30 oligodeoxynucleotides with a phosphorothioate backbone. The second

CC series comprised chimeric oligonucleotides composed of a central gap

CC region, consisting of ten 2'-deoxynucleotides, which was flanked on both

CC sides by four-nucleotide wings. The wings were composed of 2'-

CC methoxyethyl (2'-MOE) nucleotides. Both series contained the same

CC nucleotide sequences. The antisense compounds are useful for research,

CC diagnosis, treatment and prophylaxis to prevent or delay infection,

CC inflammation or tumour formation. Therapeutically the oligonucleotides

CC are highly safe and are effectively administered to humans

PT Differential display method for identifying secreted or transmembrane  
protein, comprises contacting a DNA with a first primer that hybridizes  
to a sequence coding for a leucine-rich motif and with a second  
oligonucleotide primer.

PS Disclosure; Fig 2; 37pp; English.

XX The invention relates to a differential display comprising contacting  
CC cDNA with a first primer that hybridizes to an oligonucleotide sequence  
CC coding for a leucine-rich motif, and with a second oligonucleotide primer  
CC to form a cDNA-hybrid molecule. The method comprises obtaining mRNA from  
CC at least 2 samples, synthesizing cDNA from the RNA of each sample,  
CC contacting the cDNA with a first primer that hybridizes to an  
CC oligonucleotide sequence coding for a leucine-rich motif, and with a second  
CC -hybrid molecule, detecting amplified products, amplifying the cDNA  
CC amplified products, detecting amplified products and comparing the  
CC products coding for at least one secreted or transmembrane protein. The  
CC method is useful for discovering novel secreted and/or transmembrane  
CC proteins which are important for cell processes and play an important  
CC role in determining its phenotype, and which act as mediators for the  
CC transfer of signals from external environment into the cell itself, thus  
CC modulating gene expression. Sequences ABX03792-ABX03869 represent DNA  
CC encoding secreted protein signal peptide sequences

PT Selecting target and target binder pairs for preparing a composition for  
PT treating cancer by mixing in a reaction vessel phage expressing  
PT biological targets and phage expressing target binders.

PS Example 18; SEQ ID NO 205; 172pp; English.

XX The invention relates to a novel method of selecting target and target  
CC binder pairs comprising mixing in a reaction vessel phage expressing  
CC biological targets and phage expressing target binders, each having  
CC distinguishable selection markers and selecting target and target binder  
CC pairs based on the selection markers. The molecules of the invention  
CC demonstrate cytosolic activity whilst the method may be useful for  
CC selecting target and target binder pairs for preparing a composition for  
CC treating cancer. Furthermore, the method may be utilised during gene  
CC therapy procedures. The current sequence is that of the PCR primer of the  
CC invention.

XX  Predicting, diagnosing or prognosing chronic lung disease, by detecting a
XX  chronic obstructive pulmonary disease (COPD) gene in a biological sample.
XX  Example 1; Page 213; 214pp; English.
XX  The present invention describes a method for predicting, diagnosing or
XX  prognosing chronic lung disease by detecting a chronic obstructive
XX  pulmonary disease (COPD) gene related polynucleotide (see ACC46750 to
XX  ACC46777, which encode the COPD related proteins in ABP96779 to
XX  ABP96806). The method is useful for predicting, diagnosing or prognosing
XX  chronic lung disease in a biological sample. The COPD genes and proteins
XX  encoded by them from the present invention (I) can be used for treating
XX  or preventing chronic lung disease in a mammal. (I) can be used in an
XX  animal model for determining the efficacy, toxicity, or side effects of
XX  treatment with (I), and determining the mechanism of action of (I).

XX WPL; 2003-229219/22.
XX  Pharmaceutical composition for treating ailments associated with impaired
XX  respiration, has oligo(s) antisease to specific gene(s) or its
XX  corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
XX  ubiquinone.
XX  Disclosure; SEQ ID NO 13566; 872pp; English.
XX  The invention relates to a novel pharmaceutical composition, which has a
XX  first active agent comprising an oligonucleotide antisease to the
XX  initiation codon, coding region, 5' or 3' end genomic flanking regions,
XX  5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
XX  junctions of genes encoding a polypeptide associated with lung and/or
XX  nasal airway dysfunction and a second active agent comprising an
XX  antiinflammatory steroid and ubiquinone. A composition of the invention
XX  has antiinflammatory, antiallergic, antiaesthetic, hypotensive,
XX  immunosuppressive, and cytoskeletal activity. The composition may have a
XX  use in antisease gene therapy. The composition is useful for treating or
XX  preventing a respiratory, lung or malignant disease or condition, also
XX  for enhancing the prophylactic or therapeutic respiratory effect of an
XX  antiinflammatory steroid in a subject, for reducing or depleting levels
XX  of, or reducing sensitivity to adenosine, reducing levels of adenosine
XX  receptor, producing bronchodilation, increasing levels of ubiquinone or
XX  lung surfactant in a subject's tissue, or treating bronchoconstriction,
XX  lung inflammation, lung allergies, or a respiratory disease or condition.

 PT A new isolated LPS-responsive and Beige-like Anchor polypeptide useful  
 PT for inhibiting growth of tumors in a patient.  
 XX  
 PS Example 5; Page 45; 79pp; English.  
 CC This invention relates to a novel isolated LPS-responsive and Beige-like  
 CC Anchor (Irida) polypeptide which may be used to inhibit tumour growth. The  
 CC invention also comprises an interfering RNA sequence which may be used to  
 CC suppress Irida function and inhibit tumour growth. The polypeptide and  
 CC small interfering RNA (siRNA) molecules of the invention may have  
 CC cytostatic activity and may be used in gene therapy. Also disclosed is a  
 CC method for inhibiting tumour growth in a patient comprising administering  
 CC to the patient an agent that suppresses Irida function in the patient.  
 CC agent may be a polynucleotide fragment of an Irida gene or its variant, or  
 CC a polypeptide fragment of an Irida gene or its variant or an RNA sequence  
 CC that interferes with the expression of the Irida gene. The method of the  
 CC invention may be used to treat a patient who is suffering from a tumour  
 CC or a cancer, such as breast, prostate, melanoma, cervical or colorectal  
 CC cancer, chronic myelogenous leukemia, adenocarcinoma, lymphoblastic  
 CC leukemia or lung carcinoma. The present sequence represents a DNA  
 CC sequence used within the scope of the invention

 PT Pharmaceutical composition for treating asthma, has antisense  
 PT oligonucleotide containing less percentage of adenosine, targeted to

PT nucleic acids associated with lung airway or lung dysfunction, and  
 PT bronchodilating agent.  
 XX  
 PS Claim 15; SEQ ID NO 13566; 763pp; English.  
 CC  
 CC This invention describes a novel composition (a) a first active agent,  
 CC comprising oligonucleotides, effective for alleviating allergies and  
 CC bronchoconstriction, respiratory tract inflammation, allergies and  
 CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,  
 CC surfactant depletion or hyposecretion, when administered to a mammal. The  
 CC oligonucleotides are derived from a gene encoding or regulating  
 CC expression of a target polypeptide associated with lung airway or lung  
 CC dysfunction or cancer and can be anti-sense to the corresponding mRNA.  
 CC The invention also describes a kit, that comprises: (a) a delivery  
 CC device, in separate containers, (b) the oligonucleotides, (c)  
 CC instructions for adding a carrier and for use of the kit. The composition  
 CC of the invention has anti-allergic, anti-inflammatory, antiasthmatic,  
 CC analgesic, hypotensive, immunosuppressive and cycostatic activity, is a  
 CC beta-adrenergic agonist. The composition is useful for preventing or  
 CC treating a respiratory, lung or malignant disease. The administered  
 CC composition comprises oligo and is administered to reduce the production  
 CC or availability, or to increase the degradation of the target mRNA or to  
 CC reduce the amount of target polypeptide present in the lungs. The  
 CC pulmonary obstruction, and/or bronchoconstriction and/or lung  
 CC inflammation, allergies and/or surfactant hypoproduction are associated  
 CC with a disease or condition such as pulmonary vasoconstriction,  
 CC inflammation, allergies, asthma, impeded respiration, respiratory  
 CC distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary  
 CC hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary  
 CC transplantation rejection, pulmonary infections, bronchitis or cancer.  
 CC The reduced adenosine content of the anti-sense oligos corresponding to  
 CC thymidines present in the target RNA serves to prevent the breakdown of  
 CC the oligonucleotides into products that free adenosine into the system  
 CC e.g., lung, brain, heart, kidney, etc. tissue environment and thereby, to  
 CC prevent any unwanted effects due to it

 PT New polymorphisms of the phenotype associated gene, useful for preparing  
 PT a medicament for treating cardiovascular disease, e.g. atherosclerosis,  
 PT myocardial infarction or stroke, or for predicting adverse drug reaction.  
 XX  
 XX Example; Page 27; 67pp; English.  
 CC The invention relates to a new isolated polynucleotide encoded by a  
 CC phenotype associated (PA) gene, and comprising a sequence selected from  
 CC 21 fully defined sequences of 544-1245 bp with an allelic variation  
 CC contained in a functional surrounding like full length cDNA for PA gene  
 CC polypeptide and with or without the PA gene promoter sequence. The PA  
 CC gene fragments can be used for determining whether a human subject has,  
 CC or is at risk of developing a cardiovascular disease. The method involves  
 CC determining the identity of nucleotide variations in SEQ ID Nos: 1-21 of  
 CC the PA gene locus of the subject, where the single nucleotide  
 CC polymorphism (SNP) class of the SNP is cardiovascular disease (CVD)  
 CC related, and a risk genotype has a risk ratio of greater than 1. The PA  
 CC gene polypeptide or a reagent that modulates its activity may be used in  
 CC the preparation of a medicament for treating CVD (e.g. atherosclerosis,  
 CC ischaemia/reperfusion, hypertension, restenosis, arterial inflammation,  
 CC myocardial infarction, or stroke), or influence drug response. Also  
 CC provided is a method of determining individual response to statin  
 CC therapy, useful in the preparation of a medicament tailored to suit a  
 CC patient's individual response to statin therapy. Sequences ADJ77897-  
 CC ADJ77964 represent oligonucleotide primers used for genotyping PA gene  
 CC using mass spectrometry.

 XX A primer set and method useful for mapping at least the  
 PT variation/mutation part of a plant gene using a gene polymorphism marker.  
 XX Claim 7; SEQ ID NO 949; 120pp; Japanese.

```

XX CC The present invention relates to a primer set and method for mapping at
CC CC least the variation/mutation part of a plant gene using a gene
CC CC polymorphism marker. A mutation site of the plant gene is mapped by
CC CC utilizing a genetic polymorphism marker as follows: (a) genomic DNA is
CC CC prepared from a plant homozygously having a mutation to be an object of
CC CC the mapping; (b) A forward primer 1 containing a base corresponding to
CC CC the gene polymorphic marker of one ecotype plant, a forward primer 2
CC CC containing a base corresponding to the genetic polymorphism of the other
CC CC ecotype plant and a reverse primer 3 based on the base sequence common
CC CC with both the ecotype plants are prepared; (c) two kinds of
CC CC oligonucleotides emitting fluorescence of different colors when the
CC CC genetic polymorphism marker is detected are prepared; (d) an
CC CC amplification reaction of the genomic DNA is carried out in the presence
CC CC of the primers 1, 2 and 3 and the two kinds of the oligonucleotides; (e)
CC CC the fluorescence intensely emitted from the resultant reaction product
CC CC is detected and (f) the position on the genome of the mutation site is
CC CC determined from the results of detection. The present sequence is a
CC CC primer, used to illustrate the invention.

XX The invention relates to a method of producing a transformable corn line
XX by introgressing at least one chromosomal locus mapping to bin 6.02-6.04
XX or bin 10.04-10.06, where the locus is introgressed from a more
XX transformable corn line into a less transformable corn line. The

```

```

CC CC invention also relates to corn variety 178-187-20 seed (ATCC accession
CC CC no. PTA-5183) and corn variety 178-74-25 seed (ATCC accession no. PTA-
CC CC 5182); progeny of a plant grown from the seed cited above, where the
CC CC progeny comprises loci mapping to chromosomal bins 1.03-1.06, 1.08-1.11,
CC CC 3.05-3.07, and 6.02-6.04; a transgenic corn plant produced by
CC CC transforming the progeny cited above; and hybrid corn seed and plants
CC CC produced by crossing a corn line with the progeny cited above. Because
CC CC more transformable lines are typically agronomically poor, while lines
CC CC with superior or desired agronomic traits tend to be less transformable,
CC CC the methods of the invention provide a means of testing for the effects
CC CC of an introduced gene on traits such as yield, kernel quality and plant
CC CC phenotype in earlier plant generations in a breeding programme. Sequences
CC CC ADN61671-ADN61702 represent PCR primers used in an example of the
CC CC invention to amplify corn SSR markers useful in marker assisted breeding.

```

PT	RANTES, MCP4, useful for prophylaxis or treating respiratory disease e.g. asthma.
PS	Claim 2; SEQ ID NO 1045; 174pp; English.
XX	The invention relates to oligonucleotides anti-sense to an initiation codon, coding region, 5' or 3' intron-exon junction, intron or region with 2-10 nucleotides of the 5'-end or 3'-end of a nucleic acid target chosen from a gene encoding interleukin (IL)-4 receptor, interleukin (IL)-5 receptor, CCR1, CCR3, Eotaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a, tryptase b, PDE4 A, PDE4 B, PDE4 C or PDE4 D. The invention also relates to a method of screening a candidate compound that binds to one or more nucleic acid target(s) or expressed product(s), for the prevention and/or treatment of a respiratory or lung disease. The oligonucleotides are useful for reducing or inhibiting expression of a gene or mRNA encoding interleukin-4 receptor, interleukin-5 receptor, CCR1, CCR3, Eotaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a, tryptase b, PDE4 A, PDE4 B, PDE4 C, or PDE4 D. The oligonucleotides are useful for preventing or treating a respiratory or lung disease. The respiratory or lung disease is associated with hyper-responsiveness to and/or increased levels of, adenosine and/or levels of adenosine A receptor(s), and/or asthma and/or lung allergies associated with inflammation or an inflammatory disease. The respiratory or lung disease is chosen from airway inflammation, allergy, asthma, impeded respiration, cystic fibrosis (CF), chronic obstructive pulmonary disease (COPD), allergic rhinitis, acute respiratory distress syndrome, pulmonary hypertension, lung inflammation, bronchitis, airway obstruction or bronchoconstriction. This sequence represents an oligonucleotide of the invention.

XX      Interference RNA agent useful for treating dyslipidaemia, coronary artery
XX      disease, diabetes, cancer or neurological disease, comprises sense
XX      sequence and antisense sequence which has specific modifications.
XX      Example 5; SEQ ID NO 3443; 378pp; English.
XX      The invention describes a RNA interference (iRNA) agent (I) comprising a
XX      sense sequence and an antisense sequence, where the sense sequences have
XX      one or more asymmetrical 2'-O alkyl modifications, the antisense
XX      sequences have one or more asymmetrical phosphorothioate modifications
XX      and the antisense sequence targets a human gene sequence. Also described
XX      are: a pharmaceutical preparation comprising (I); reducing (M) apoB-100
XX      levels or glucose-6-phosphatase levels in a subject; producing (I);
XX      stabilising (I), involves selecting a sequence with activity and
XX      introducing one or more asymmetrical modification in the sequence, where
XX      the modification decreases nuclease sensitivity while not decreasing its
XX      activity; a kit comprising (I) and instructions for its use; and a device
XX      that can be dispense or administer a composition comprising (I). (I) is
XX      useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M)
XX      is useful for reducing apoB-100 levels or glucose-6-phosphatase levels.
XX      The subject is suffering from a disorder characterised by elevated or
XX      otherwise unwanted expression of apoB-100, elevated or otherwise unwanted
XX      levels of cholesterol, and/or dysregulation of lipid metabolism. The
XX      disorder is chosen from the HDL/LDL cholesterol imbalance,
XX      dyslipidaemia, hypercholesterolaemia, statin-resistant
XX      hypercholesterolaemia, coronary artery disease (CAD), coronary heart
XX      disease (CHD) and atherosclerosis. (I) is administered to a subject to
XX      inhibit hepatic glucose production or for treating glucose-metabolism-
XX      related disorder e.g. diabetes or type-2 diabetes. (I) is useful for
XX      treating the diseases as mentioned above, cancer (e.g. breast, colon or
XX      lung cancer), neurological disease (e.g., Huntington disease or
XX      spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence
XX      represents a human apolipoprotein B (ApoB) antisense oligonucleotide that
XX      can be used to control ApoB gene expression.

 PT New peptide nucleic acid oligomers hybridizing to adhesion molecule genes  
 PT - are stable anti-sense cpts. of high affinity, partic. for treating  
 PT inflammation, viral infection, cancer etc.  
 XX  
 XX Claim 18; Page 45; 57pp; English.  
 XX  
 CC New oligomers are claimed which (A) have at least one peptide nucleic  
 CC acid (PNA) subunit and (B) have a sequence hybridizable to AUG region,  
 CC coding region, 5'-untranslated region or 3'-untranslated region of ICAM-1  
 CC or ELAM-1, or hybridizable to AUG region, coding region, 5'- untranslated  
 CC region, exon/intron junction region or 3'-untranslated region of VCAM-1.  
 CC The PNAs can be used to target RNA and single stranded DNA (ssDNA) to  
 CC produce antisense-type gene regulation moieties. Hence they may be used  
 CC therapeutically for modulating cellular adhesion and thus as  
 CC antineoplastic agents, anticancer agents, antirhinoviral agents, anti-  
 CC AIDS agents and antiinflammatory agents. They may also be useful as  
 CC diagnostics, e.g. as probes for specific mRNAs. PNA oligomers have high  
 CC affinity for complementary single stranded DNA. They are also able to  
 CC form triple helices in which a first PNA strand binds with RNA or ssDNA  
 CC and a second PNA strand binds with the resulting double helix or with the  
 CC first PNA strand. The PNAs possess no significant charge and are water  
 CC soluble, which facilitates cellular uptake. Further, since they contain  
 CC amides of non-biological amino acids, they are biostable and resistant to  
 CC enzymatic degradation by proteases. The present sequence targets vascular  
 CC cell adhesion molecule-1 (VCAM-1) translation initiation codon (AUG)

 XX  
 CC AA030211-T30233, AA03058-T33112 and AA03667-T36684 represent antisense  
 CC oligonucleotides of the invention. These sequences target regions of the  
 CC coding sequences for human intercellular adhesion molecule-1 (ICAM-1),  
 CC endothelial leukocyte adhesion molecule-1 (ELAM-1, also known as E-  
 CC selectin), or vascular cell adhesion molecule-1 (VCAM-1). ICAM-1, ELAM-1,  
 CC and VCAM-1 represent three of the five cell adhesion molecules involved  
 CC in the adherence of white blood cells to vascular endothelium. These  
 CC sequences can be used in a composition for treating allograft rejection.  
 CC The composition contains one of these sequences in combination with an  
 CC immunosuppressive agent. The immunosuppressive agent used in the  
 CC compositions is bregminal, rapamycin, anti-lymphocyte serum, a monoclonal  
 CC antibody against LFA-1 or an antisense oligonucleotide. The compositions  
 CC can be used for treating or preventing allograft rejection, such as  
 CC cardiac or renal allograft rejection. By using these compositions,  
 CC allograft survival times are extended, and donor-specific transplant  
 CC tolerance is induced

 XX New antisense oligonucleotides, used for treating e.g. inflammatory  
 PT conditions, psoriasis, graft rejection, cancers, infections,  
 PT cardiovascular disorders or autoimmune disorders.  
 XX  
 XX Disclosure; Page 182; 1999p; English.  
 PS  
 XX This sequence is an antisense oligonucleotide of the invention. The  
 CC antisense oligonucleotides are targeted to a nucleic acid encoding a  
 CC cellular adhesion molecule (CAM) and is capable of modulating the  
 CC expression of the CAM. They particularly inhibit intercellular adhesion  
 CC molecule-1 (ICAM-1), vascular cell adhesion molecule-1 (VCAM-1), or  
 CC endothelial leukocyte adhesion molecule-1 (ELAM-1). The antisense  
 CC oligonucleotides can be used to modulate CAM activity in mediating  
 CC cell-cell interactions and subsequent cellular and biological responses,  
 CC e.g. T cell activation, leukocyte transmigration and inflammation. The  
 CC antisense sequences can be used for modulating the synthesis of a CAM.  
 CC They can be used for treating an animal suspected of having or being  
 CC prone to a disease or condition associated with a CAM. Oligonucleotides  
 CC targeted to ICAM-1 can be used for treating an inflammatory disease or  
 CC condition e.g. inflammatory bowel disease such as Crohn's disease,  
 CC colitis or ulcerative colitis, a condition of the skin, e.g. psoriasis or  
 CC cytotoxic dermatitis, rheumatoid arthritis, allograft rejection, cancer,  
 CC pneumonia, multiple sclerosis or a viral infection. The ICAM-1 sequences  
 CC can also be used for reducing corticosteroid use in a patient or for  
 CC reducing cyclosporine use in a patient. The oligonucleotides can also be  
 CC used for detection and diagnosis. They can also be used for treating e.g.  
 CC hyperproliferative disorders, tumours, diapedesis, graft versus host  
 CC disease, arthritis, infections, autoimmune disorders, e.g. autoimmune  
 CC thyroid disorders, autoimmune forms of arthritis, multiple sclerosis,  
 CC some forms of juvenile diabetes mellitus, myasthenia gravis, pemphigus  
 CC vulgaris, systemic lupus erythematosus, cardiovascular disorders,  
 CC myocardial ischaemia/reperfusion injury, dilated cardiomyopathy, acute  
 CC myocarditis, ischaemic heart disease or stroke

 XX Modulating levels of high density, low density and very low density  
 PT lipoprotein cholesterol and apolipoprotein AI, using LIPG genes or  
 PT polypeptides and modulators of their expression and activity.  
 XX  
 XX Example 3; Fig 1; 171pp; English.  
 PS  
 XX The present sequence represents a PCR primer which was used to amplify  
 CC cDNA encoding a human lipG polypeptide (a lipase enzyme of the  
 CC triacylglycerol lipase family). LipG is synthesised by endothelial cells,  
 CC and is therefore an endothelial lipase. The LIPG polynucleotides and  
 CC polypeptides are used for modulating levels of high density lipoprotein  
 CC (HDL), low density lipoprotein (LDL) and very low density lipoprotein  
 CC (VLDL) cholesterol and apolipoprotein AI. Specifically, HDL cholesterol  
 CC and apolipoprotein AI levels are raised, and LDL and VLDL cholesterol  
 CC levels lowered, by modulating the expression and activity of the LIPG  
 CC polypeptide

 CC dermatological, cytostatic, antiseborrheic, anti-diabetic, anti-skin,  
 CC ophthalmological, vulvar, keratolytic and virucidal activities, and  
 CC cleaves RNA encoding cytokine involved in inflammation. (I) can be used  
 CC in gene therapy. (I) and (II) are useful for treating proliferative skin  
 CC diseases such as psoriasis, atopic dermatitis, actinic keratosis,  
 CC squamous or basal cell carcinoma and viral or seborrheic wart. They can  
 CC also be used for treating proliferative eye diseases such as diabetic  
 CC retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of  
 CC prematurity and retinal detachment, and for treating and preventing  
 CC scarring such as keloid, adhesion and hypertrophic or hypertrophic burn  
 CC scar. AAH57577 to AAH62099 represent sequences used in the  
 CC exemplification of the present invention

 PT inflammation.  
 XX  
 XX Example 3; SEQ ID NO 147; 145bp; English.  
 PS  
 XX The invention relates to short interfering nucleic acids (siNA) which  
 CC downregulate expression of the human c-fos gene by RNA interference. The  
 CC siNAs may or may not comprise ribonucleotides and may be double or single  
 CC stranded. They further comprise sense and antisense regions, or  
 CC alternatively are assembled from a sense oligonucleotide and an antisense  
 CC oligonucleotide. Specifically, the siNAs include short interfering RNA  
 CC (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA  
 CC (shRNA). The siNAs can be unmodified or chemically modified, can contain  
 CC deoxyribonucleotides, and can be chemically synthesised, expressed from a  
 CC vector or enzymatically synthesised. The invention also relates to kits  
 CC for the in vitro or in vivo delivery of siNA; conjugates and/or complexes  
 CC of siNA; and vectors that express siNA. The siNAs are used to modulate  
 CC expression of the c-fos gene in cells, tissue explants or organisms  
 CC (e.g., by ex vivo gene therapy), or in grafts and transplants for the

CC treatment of a variety of conditions. They may be used for treating  
 CC central nervous system lesions and injuries (e.g., Alzheimer's disease,  
 CC Parkinson's disease, Huntington's disease, epilepsy, dementia or  
 CC amyotrophic lateral sclerosis); various cancers; other proliferative  
 CC diseases (e.g., restenosis and polycystic kidney disease); inflammatory  
 CC and/or allergic diseases; viral infections (including HIV infection);  
 CC autoimmune diseases; and transplant rejection. The siNAs are also useful  
 CC for drug screening, diagnosis, therapeutic target identification and  
 CC validation, genetic engineering, pharmacogenomics, studying gene  
 CC function, and gene mapping (e.g., of single nucleotide polymorphisms).  
 CC The present sequence represents the lower strand of a human c-fos-  
 CC targeted double-stranded siNA.

PT the BCL2 gene.  
XX  
XX Example 3; SEQ ID NO 658; 148bp; English.  
XX  
CC The invention relates to a novel short interfering nucleic acid (siNA)  
CC that downregulates expression of the BCL2 gene by RNA interference. A  
CC siNA of the invention has cytosolic, immunosuppressive, virucide, and  
CC anti-HIV activity. The siNA are useful for modulation (inhibition) of  
CC expression or activity of BCL2 by RNA interference. siNA are used to  
CC modulate expression of BCL2 genes, in cells, tissue explants or  
CC organisms, e.g. for treating cancer, autoimmune diseases and viral  
CC infections (including by HIV) but also for drug screening, diagnosis,  
CC target identification and validation, genetic engineering,  
CC pharmacogenomics, studying gene function and gene mapping (e.g. of single  
CC -nucleotide polymorphisms). The sequences shown in ADF49273-ADP50143  
CC represent siNA of the invention.

XX  
XX Example 3; SEQ ID NO 65; 147bp; English.  
XX  
CC The invention relates to short interfering nucleic acids (siNA) which  
CC downregulate expression of the human insulin-like growth factor 1  
CC receptor (IGF-1R) gene by RNA interference. The siNA may or may not  
CC comprise ribonucleotides and may be double or single stranded. They  
CC further comprise sense and antisense regions, or alternatively are  
CC assembled from a sense oligonucleotide and an antisense oligonucleotide.  
CC Specifically, the siNA include short interfering RNA (siRNA), double-  
CC stranded RNA, micro-RNA (miRNA) and short hairpin RNA (shRNA). The siNA  
CC can be unmodified or chemically modified, can contain  
CC deoxyribonucleotides, and can be chemically synthesised, expressed from a  
CC vector or enzymatically synthesised. The invention also relates to kits  
CC for the in vitro or in vivo delivery of siNA; conjugates and/or complexes  
CC of siNA; and vectors that express siNA. The siNA are used to modulate  
CC expression of the IGF-1R gene in cells, tissue explants or organisms  
CC (e.g., by ex vivo gene therapy), or in grafts and transplants for the  
CC treatment of a variety of conditions. They may be used for treating  
CC cancer and other proliferative diseases (e.g., restenosis and polycystic  
CC kidney disease), inflammatory and/or allergic diseases, autoimmune  
CC diseases and transplant rejection. The siNA are also useful for drug  
CC screening, diagnosis, therapeutic target identification and validation,  
CC genetic engineering, pharmacogenomics, studying gene function, and gene  
CC mapping (e.g., of single nucleotide polymorphisms). The present sequence  
CC represents the upper strand of a human IGF-1R-targeted double-stranded  
CC siNA, which is identical to the IGF-1R transcript target sequence.

 DR Novel short interfering RNA (siRNA) comprises sense and antisense RNA  
 PT strands useful for inhibiting expression of human vascular endothelial  
 PT growth factor mRNA, for treating angiogenic disease, e.g. diabetic  
 PT retinopathy and cancer.  
 XX Disclosure; SEQ ID NO 31; 218pp; English.  
 XX This invention relates to novel compositions that comprise short  
 CC interfering RNA (siRNA) molecules, which can be used to inhibit  
 CC angiogenesis. Specifically, it refers to siRNAs that target and cause  
 CC RNAi-induced degradation of mRNA from human vascular endothelial growth  
 CC factor (VEGF), the VEGF receptor (Flt-1) and the Flk-1/KDR (kinase domain  
 CC region) genes, as well as mutants derived thereof. The present invention  
 CC describes sense and antisense RNA strands that form an RNA duplex and  
 CC bind to the target mRNA, such that expression is inhibited and the target  
 CC degraded. As such, siRNA administered in combination with a therapeutic  
 CC agent is useful for treating diseases associated with angiogenesis and  
 CC the overexpression of VEGF, which include diabetic retinopathy, age-  
 CC related macular degeneration, inflammatory disease, psoriasis and  
 CC rheumatoid arthritis. Furthermore, it can be used to treat various  
 CC cancers including breast, retinoblastoma, Wilms' tumor and lymphoma.  
 CC Accordingly, these compositions exhibit cytostatic, antidiabetic,  
 CC ophthalmological, antiinflammatory, antipsoriatic, antineumatic and  
 CC antiarthritic activities. This oligonucleotide is a human VEGF DNA oligo,  
 CC a target for siRNA inhibition of the invention.

 PT New antisense oligonucleotide, useful for diagnosing, as research  
 PT reagents and for treating disease states, which respond to modulation of  
 PT the synthesis or metabolism of cell adhesion molecules.  
 XX Disclosure; SEQ ID NO 43; 72pp; English.  
 XX The invention relates to an antisense oligonucleotide targeting human  
 CC intercellular adhesion molecule (ICAM-1) having a sequence appearing as  
 CC ADM46473. In the oligonucleotide, at least one adenosine nucleotide is  
 CC replaced with a thymidine, cytidine or guanosine nucleotide, at least one  
 CC thymidine nucleotide is replaced with an adenosine, cytidine or guanosine  
 CC nucleotide, at least one guanosine nucleotide is replaced with an  
 CC adenosine, thymidine or cytidine nucleotide or at least one cytidine  
 CC nucleotide is replaced with an adenosine, cytidine or guanosine  
 CC nucleotide. The oligonucleotide is one of 88 disclosed antisense  
 CC oligonucleotides targeting ICAM-1, vascular cell adhesion molecule (VCAM-  
 CC 1) or endothelial leukocyte adhesion molecule (ELAM-1). Also included are  
 CC an RNA compound 8-80 nucleobases in length targeted to human ICAM-1 mRNA  
 CC (where the compound specifically hybridizes with the human ICAM-1 mRNA  
 CC and inhibits the expression of human ICAM-1 mRNA), and a double stranded  
 CC RNA compound having the RNA equivalent sequence of ADM46473. The  
 CC oligonucleotide is useful for modulating the activity of the RNA and DNA  
 CC and the modulation of the synthesis and metabolism of specific cell  
 CC adhesion molecules. It is also useful for the diagnosis, as research  
 CC reagents and for treating disease states, which respond to modulation of  
 CC the synthesis or metabolism of cell adhesion molecules. The  
 CC oligonucleotide is suitable for treating inflammatory ophthalmological  
 CC disorders including redness and inflammation caused by allergens and  
 CC allergic reactions. The oligonucleotides can also be used to preserve  
 CC corneal explants ex vivo and to prevent corneal allograft rejections. The  
 CC specific hybridisation exhibited by the oligonucleotides may be used for  
 CC assays, purifications or cellular product preparations. The present  
 CC sequence is an antisense oligonucleotide targeting VCAM-1.

PT Assessing an individual for a cancer condition, useful for treating e.g.
PT breast cancer, comprising determining the presence in a tissue sample of
PT one or more cells comprising a plexinB1 nucleic acid sequence having one
PT or more mutations.
XX
PS Disclosure; Fig 3; 97pp; English.
XX
CC This invention relates to a novel method of assessing an individual for a
CC cancer condition which comprises providing a tissue sample obtained from
CC the individual, determining the presence in the sample of one or more
CC cells comprising a plexinB1 nucleic acid sequence having one or more
CC mutations, the presence of the cells being indicative of the individual
CC having a cancer condition. The invention may be useful for the
CC development of compounds with a cytostatic activity acting as a plexin-
CC antagonist-B-1 whilst the sequences disclosed may prove useful for gene
CC therapy. The method is useful for assessing an individual for a cancer
CC condition particularly prostate cancer or breast cancer. The
CC pharmaceutical compound is useful for a method of treatment and for
CC manufacturing a medicament for treating cancer. A nucleic acid encoding
CC plexinB1 or mutant plexinB1 polypeptide or its complement or fragment is
CC useful in a method of treatment, particularly cancer and for
CC manufacturing a medicament for treating cancer. A method comprising
CC reducing the activity of mutant plexinB1 polypeptide in one or more cells
CC of an individual by administering an antagonist of mutant plexinB1 is
CC useful for treating a cancer condition in the individual, where such
CC activity is reduced by decreasing or abolishing expression of the mutant
CC plexinB1 polypeptide or expression of the mutant plexin B1 polypeptide is
CC abolished or reduced by administering a nucleic acid above. The method is
CC also useful for reducing the invasiveness of a tumour in an individual.
CC The methods are useful for characterising a cancer condition, for example
CC for prognostic purposes. The present sequence is that of a region of the
CC human plexinB1 gene in which a mutation used in the method of the
CC invention was identified.

PT Selecting siRNA by selecting an siRNA molecule of 19-25 nucleoside bases
PT by selecting a target gene and measuring the functionality of the
PT nucleotide sequences that are complementary to a stretch of nucleotides
PT of the target sequence.
XX
PS Example 16; SEQ ID NO 2397; 199pp; English.
XX
CC The invention relates to a novel method for selecting siRNA (short
CC interfering RNA) comprising selecting an siRNA molecule of 19-25
CC nucleoside bases by selecting a target gene and measuring the
CC functionality of sequences of 19-25 nucleotides in length that are
CC substantially complementary to a stretch of nucleotides of the target
CC sequence, where the functionality is dependent upon non-target specific
CC criteria. Also claimed are methods for gene-silencing, developing an
CC siRNA algorithm for selecting siRNA, selecting an siRNA with improved
CC functionality, selecting hyperfunctional siRNA, an siRNA molecule
CC effective at silencing Bcl-2, and a kit for gene silencing comprising the
CC siRNA. The siRNA molecule comprises a sequence substantially similar to a
CC sequence consisting of GGGAGUAGUGAUGAAGU, GAAGUACUCCAUUUAAG;
CC GUACGACAAACCGGAGAU, AGAUGUAGUAGAUACAU, UGAAGACUUGUCUAGUU;
CC CUGGCGCCUCUGUUGA, UCGGCGCCUCUGUAGAU, GAGAUAGUGAUGAUGACA;
CC GAGAUAGUGAUGAUGAUG, and GAAGACUUGUCUAGUUG. The siRNA molecule
CC comprises a sense strand and an anti-sense strand. The siRNA molecule
CC comprises a hairpin. The siRNA molecule comprises between 18 and 30 base
CC pairs. The kit comprises at least two siRNA, comprising a first optimised
CC siRNA and a second optimised siRNA. The method is useful in selecting
CC siRNA for generating a gene silencing reagent. The present sequence is
CC used in the exemplification of the invention.

 PT Interference RNA agent useful for treating dyslipidemias, coronary artery  
 PT disease, diabetes, cancer or neurological disease, comprises sense  
 PT sequence and antisense sequence which has specific modifications.  
 XX  
 PS Example 5; SEQ ID NO 5275; 378bp; English.  
 XX  
 CC The invention describes a RNA interference (iRNA) agent (I) comprising a  
 CC sense sequence and an antisense sequence, where the sense sequences have  
 CC one or more asymmetrical 2'-O alkyl modifications, the antisense  
 CC sequences have one or more asymmetrical phosphorothioate modifications  
 CC and the antisense sequence targets a human gene sequence. Also described  
 CC are: a pharmaceutical preparation comprising (I); reducing (M1) apob-100  
 CC levels or glucose-6-phosphate levels in a subject; producing (I);  
 CC stabilising (I), involves selecting a sequence with activity and  
 CC introducing one or more asymmetrical modification in the sequence, where  
 CC the modification decreases nuclease sensitivity while not decreasing its  
 CC activity; a kit comprising (I) and instruction for its use; and a device  
 CC that can be dispense or administer a composition comprising (I). (I) is  
 CC useful for reducing apob-100 levels or glucose-6-phosphate levels. (M1)  
 CC is useful for reducing apob-100 levels or glucose-6-phosphate levels.  
 CC The subject is suffering from a disorder characterised by elevated or  
 CC otherwise unwanted expression of apob-100, elevated or otherwise unwanted  
 CC levels of cholesterol, and/or dysregulation of lipid metabolism. The  
 CC disorder is chosen from the HDL/LDL cholesterol imbalance,  
 CC dyslipidaemias, hypercholesterolaemia, statin-resistant  
 CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart  
 CC disease (CHD) and atherosclerosis. (I) is administered to a subject to  
 CC inhibit hepatic glucose production or for treating glucose-metabolism-  
 CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for  
 CC treating the diseases as mentioned above, cancer (e.g. breast, colon or  
 CC lung cancer), neurological disease (e.g., Huntington disease or  
 CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence  
 CC represents a human apolipoprotein B (Apob) antisense oligonucleotide that  
 CC can be used to control Apob gene expression.

PT interference RNA agent useful for treating dyslipidaemias, coronary artery  
 PT disease, diabetes, cancer or neurological disease, comprises sense  
 PT sequence and antisense sequence which has specific modifications.

PS Example 5; SEQ ID NO 4332; 378pp; English.

XX The invention describes a RNA interference (iRNA) agent (I) comprising a  
 XX sense sequence and an antisense sequence, where the sense sequences have  
 XX one or more asymmetrical 2'-O alkyl modifications, the antisense  
 XX sequences have one or more asymmetrical phosphorothioate modifications  
 XX and the antisense sequence targets a human gene sequence. Also described  
 XX are: a pharmaceutical preparation comprising (I); reducing (M1) apob-100  
 XX levels or glucose-6-phosphatase levels in a subject; producing (I);  
 XX stabilising (I); involves selecting a sequence with activity and  
 XX introducing one or more asymmetrical modification in the sequence, where  
 XX the modification decreases nuclease sensitivity while not decreasing its  
 XX activity, a kit comprising (I) and instruction for its use; and a device  
 XX that can be dispense or administer a composition comprising (I). (I) is  
 XX useful for reducing apob-100 levels or glucose-6-phosphatase levels. (M1)  
 XX is useful for reducing apob-100 levels or glucose-6-phosphatase levels.  
 XX The subject is suffering from a disorder characterised by elevated or  
 XX otherwise unwanted expression of apob-100, elevated or otherwise unwanted  
 XX levels of cholesterol, and/or dysregulation of lipid metabolism. The  
 XX disorder is chosen from the HDL/LDL cholesterol imbalance,  
 XX dyslipidaemias, hypercholesterolaemia, statin-resistant  
 XX hypercholesterolaemia, coronary artery disease (CAD), coronary heart  
 XX disease (CHD) and atherosclerosis. (I) is administered to a subject to  
 XX inhibit hepatic glucose production or for treating glucose-metabolism-  
 XX related disorder e.g. diabetes or type-2 diabetes. (I) is useful for  
 XX treating the diseases as mentioned above, cancer (e.g. breast, colon or  
 XX lung cancer), neurological disease (e.g., Huntington disease or  
 XX spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence  
 XX represents a human apolipoprotein B (ApoB) antisense oligonucleotide that  
 XX can be used to control ApoB gene expression.

XX Manoharan M, Bumcrot D;

DR WPI; 2004-677362/66.

XX Interference RNA agent useful for treating dyslipidaemias, coronary artery  
 FT disease, diabetes, cancer or neurological disease, comprises sense  
 PT sequence and antisense sequence which has specific modifications.

XX Example 5, SEQ ID NO 2603; 378bp; English.

XX The invention describes a RNA interference (RNA) agent (I) comprising a  
 CC sense sequence and an antisense sequence, where the sense sequences have  
 CC one or more asymmetrical 2'-O alkyl modifications, the antisense  
 CC sequences have one or more asymmetrical phosphorothioate modifications  
 CC and the antisense sequence targets a human gene sequence. Also described  
 CC are a pharmaceutical preparation comprising (I); reducing (M) apob-100  
 CC levels or glucose-6-phosphatase levels in a subject; producing (I);  
 CC stabilising (I), involves selecting a sequence with activity and  
 CC introducing one or more asymmetrical modification in the sequence, where  
 CC the modification decreases nuclease sensitivity while not decreasing its  
 CC activity; a kit comprising (I) and instruction for its use; and a device  
 CC that can be dispense or administer a composition comprising (I). (I) is  
 CC useful for reducing apob-100 levels or glucose-6-phosphatase levels. (M)  
 CC is useful for reducing apob-100 levels or glucose-6-phosphatase levels.  
 CC The subject is suffering from a disorder characterised by elevated or  
 CC otherwise unwanted expression of apob-100, elevated or otherwise unwanted  
 CC levels of cholesterol, and/or dysregulation of lipid metabolism. The  
 CC disorder is chosen from the HDL/LDL cholesterol imbalance,  
 CC dyslipidaemias, hypercholesterolaemia, statin-resistant  
 CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart  
 CC disease (CHD) and atherosclerosis. (I) is administered to a subject to  
 CC inhibit hepatic glucose production or for treating glucose-metabolism-  
 CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for  
 CC treating the diseases as mentioned above, cancer (e.g. breast, colon or  
 CC lung cancer), neurological disease (e.g., Huntington disease or  
 CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence  
 CC represents a human apolipoprotein B (Apob) antisense oligonucleotide that  
 CC can be used to control Apob gene expression.

 PT Novel method for typing HLA DQB1 alleles - for tissue typing, determining  
 PT identity, and for studying disease susceptibility.  
 XX  
 PS Disclosure; Page 12; 37pp; English.

CC The sequences given in AAQ26442-57 are probes which were used within the  
 CC scope of the invention to type class II HLA DQB1 alleles. These probes  
 CC were used to screen sequences amplified from the DQB1 gene second exon  
 CC sequence. This method could be used to identify new DQB1 alleles. This  
 CC method provides a simple, rapid and precise system for DQB1 typing,  
 CC including those alleles which cannot be distinguished by serological  
 CC methods. The presence or absence of a particular HLA DQB1 allele serves  
 CC as an indicator of susceptibility to insulin-dependent diabetes mellitus  
 CC (IDDM). Accurate DQ typing is particularly important in the field of  
 CC organ transplantation and in the study of the molecular basis of disease  
 CC susceptibility. Moreover, samples from unusual sources, eg. ancient DNA  
 CC or forensic samples, can be typed, even when the DNA sample is degraded  
 CC or only present in a small amount. (Updated on 25-MAR-2003 to correct PN  
 CC field.)

 PT Enzymatic nucleic acid molecules having a hammer-head motif - used for  
 PT the treatment of arthritis, induction of graft tolerance or treatment of  
 PT auto-immune diseases.  
 XX  
 PS Example 1; Page 155; 307pp; English.

CC The present invention describes a novel enzymatic nucleic acid (ENA)  
 CC having a hammerhead motif (HM) comprising: (i) at least 5 ribose residues  
 CC ; (ii) a 2'-C-allyl modification at position 4 of the ENA; (iii) at least  
 CC ten 2'-O-methyl modifications; and (iv) a 3'-end modification. The ENA's  
 CC can inhibit collagenase and streptomycin production in the synovial  
 CC membrane of joints for the treatment or prevention of arthritis,  
 CC particularly osteoarthritis or rheumatoid arthritis. The ENA's can also  
 CC be used to treat antigen presenting cells of a donor to induce tolerance  
 CC in a recipient to an allogeneic or of a donor. They can also be used for  
 CC enhancing graft tolerance or for treating autoimmune disease, and for  
 CC treating allergies and other inflammatory conditions. The ENA's can also  
 CC be used in diagnosis. Ribozyme therapy impacts on the expression of  
 CC streptomycin without introducing the non-specific effects upon gene  
 CC expression which accompany treatment with retinoids and dexamethasone.  
 CC The concentration of ribozyme required to affect a therapeutic treatment  
 CC is lower than that required of antisense molecules, and is highly  
 CC specific. The present sequence is used in the exemplification of the  
 CC present invention

 PT Transgenic organism encoding 1st and 2nd proteins - where 2nd protein  
 PT affects post translational modification of 1st protein, useful for  
 PT expressing proteins in milk, saliva, etc.  
 XX  
 PS Example 1; Page 14; 59pp; English.  
 XX  
 CC The sequences given in AAT38742-43 represent the 5' and 3' junctions  
 CC between mMAP (mouse whey acidic protein) and PACE (paired basic amino  
 CC acid cleaving enzyme) in an mMAP/PACE construct. The construct was used  
 CC in the production of a transgenic non-human multicellular organism, e.g.  
 CC a mouse, which comprises cells incorporating 1st and 2nd polynucleotides  
 CC (PN) encoding 1st and 2nd proteins, where the expression of the 1st  
 CC protein affects the post-translational modification of the 1st protein in  
 CC the cells. The mouse may be used to obtain a post translationally  
 CC modified protein. It can be used to produce dairy prodn., with altered  
 CC compans. and properties. The PN can be used to enhance the prodn. of  
 CC substances in transgenic bioreactors, and to increase the usefulness of  
 CC prodn. produced by transgenic organisms, e.g. dairy milk, and milk-prods.

CC made by pigs, sheep and goats. (Updated on 25-MAR-2003 to correct PR  
 CC field.) (Updated on 16-OCT-2003 to standardise OS field)

 XX Enzymatic nucleic acids - which cleave RNA derived from an epidermal  
 PT growth factor receptor, useful for inhibiting cell proliferation and for  
 PT treating cancers.  
 PS  
 XX Claim 5; Page 74; 109pp; English.  
 XX  
 XX The present invention describes enzymatic nucleic acid molecules (NMs)  
 CC which specifically cleave RNA derived from an epidermal growth factor  
 CC receptor (EGF-R) gene. AAV97221 to AAV98043 and AAV98979 to AAV99090  
 CC represent specifically claimed target sequence from human EGF-R. AAV98044  
 CC to AAV98866 and AAV98867 to V9878 represent hammethead ribozymes and  
 CC hairpin ribozymes respectively for human EGF-R. The NMs are useful for  
 CC cleaving EGF-R RNA in the treatment of a condition associated with EGFR  
 CC expression levels e.g. to inhibit cell proliferation in the prevention or  
 CC treatment of cancers. The NMs can also be used as diagnostic tools to  
 CC examine genetic drift and mutations within diseased cells or to detect  
 CC the presence of EGF-R RNA in a cell

XX PT Detection of single nucleotide polymorphisms in genomes by preparation
XX PT and analysis of reduced complexity genomes, useful for genotyping,
XX PT fingerprinting and determining allele frequency of SNPs.
XX PS Disclosure; Page 59; 11pp; English.
XX CC A method has been developed for detecting the presence or absence of a
XX CC single nucleotide polymorphism (SNP) allele in a genomic sample. The
XX CC method comprises preparing a reduced complexity genome (RCG) from the
XX CC genomic sample and analysing the RCG for the presence or absence of a SNP
XX CC allele. The method can be used to characterise a tumour, to generate a
XX CC genomic pattern for an individual genome or to generate a genomic
XX CC classification code for a genome. The method can be used to assess
XX CC whether a subject is at risk for developing a disease or to identify a
XX CC set of SNP alleles associated with a disease. The method can also be used
XX CC to perform linkage analysis. AAA35944 to AAA35947 represent sequences
XX CC used in the simplification of the present invention. AAA35948 to

 XX Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense  
 PT constructs, which down regulate expression of a CD20 gene or neurite  
 PT growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and  
 PT central nervous system injury.  
 PS Claim 30; Page 169; 200Pp; English.  
 XX  
 CC The invention relates to a nucleic acid molecule which down regulates  
 CC expression of a CD20 gene and a nucleic acid molecule which down  
 CC regulates expression of a neurite growth inhibitor gene (NOGO). The  
 CC nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a  
 CC DNzyme) an Inozyme (an endolytic nucleic acid cleaving an RNA molecule  
 CC possessing an NCH motif), a G-cleaver (cleaving RNA with a NYN motif) or  
 CC an amberzyme (cleaving RNA with an NGN triplet), a zynzyme (cleaving RNA  
 CC with a YGY motif). The CD20-targeting nucleic acid is used to cleave RNA  
 CC of CD20 in the presence of a divalent cation that is preferably  $Mg^{2+}$ .  
 CC Furthermore, it may be contacted with a cell to reduce CD20 activity of  
 CC the cell and treat a patient having a condition associated with the level  
 CC of CD20. The treatment may further comprise the use of one or more  
 CC therapies. In particular, the CD20 targeting nucleic acid may be used to  
 CC treat lymphoma, leukemia, B-cell lymphoma, low-grade or follicular non-  
 CC Hodgkin's lymphoma (NHL), bulky low-grade or follicular NHL, lymphocytic  
 CC leukaemia, HIV (human immunodeficiency virus) associated NHL, mantle-cell  
 CC lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma,  
 CC immune thrombocytopaenia, and inflammatory atrophy. The NOGO-  
 CC targeting nucleic acid is used to cleave RNA of the NOGO gene in the  
 CC presence of a divalent cation that is preferably  $Mg^{2+}$ . Furthermore, the  
 CC nucleic acid may be contacted with a cell to reduce NOGO activity of the  
 CC cell and treat a patient having a condition associated with the level of  
 CC NOGO. The treatment may further comprise the use of one or more  
 CC therapies. In particular, the NOGO-targeting nucleic acid may be used to  
 CC treat central nervous system (CNS) injury and cerebrovascular accident  
 CC (CVA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS),  
 CC chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (ALS),  
 CC Parkinson's disease, ataxia, Huntington's disease, Creutzfeldt-Jakob  
 CC disease, muscular dystrophy, and/or other neurodegenerative disease  
 CC states which respond to the modulation of NOGO expression. The present  
 CC sequence is an amberzyme molecule of the invention

XX New polypeptide, for raising antibodies that recognize hGDMPLP-1 proteins,  
PT or as specific biomolecule capture probes for surface-enhanced laser  
PT desorption ionization, comprises human myosin-like protein hGDMPLP-1.  
XX  
XX disclosure; SEQ ID NO 1825; 214pp; English.

XX The present invention describes a human genome-derived myosin-like  
CC protein 1 (hGDMPLP-1). The protein and vaccine production. The hGDMPLP-1  
CC 1 can be used in gene therapy and vaccine production. The hGDMPLP-1  
CC nucleic acids can be used as probes to detect, characterize and quantify  
CC hGDMPLP-1 nucleic acids in samples, as amplification substrates, to  
CC provide initial substrates for the recombinant engineering of hGDMPLP-1  
CC protein variants having desired phenotypic improvements, and for  
CC expressing the proteins. The hGDMPLP-1 proteins or polypeptides may be  
CC used as immunogens to raise antibodies that specifically recognise hGDMPLP-  
CC 1-proteins, as standards in assays used to determine the concentration  
CC and/or amount specifically of hGDMPLP proteins, as specific biomolecule  
CC capture probes for surface-enhanced laser desorption/ionisation, as  
CC therapeutic supplement in patients having specific deficiency in hGDMPLP-1  
CC production, and in vaccines or for replacement therapy. The  
CC polynucleotide sequences encoding hGDMPLP-1 may be used for diagnosing a  
CC disorder associated with the expression of hGDMPLP-1, in particular heart  
CC and skeletal muscle disorders. hGDMPLP-1 is localised to chromosome 22.  
CC The present sequence represents an oligomer used in the screening of the  
CC hGDMPLP-1 sequence in the exemplification of the present invention. N.B.  
CC The sequence data for this patent did not form part of the printed  
CC specification, but was obtained in electronic format directly from WIPO

 PT Enzymatic polynucleotide that down regulates expression of chloride  
 PT channel calcium activated gene, useful for treating Chronic obstructive  
 PT pulmonary disease (COPD), chronic bronchitis and asthma.  
 XX  
 PS Claim 4; Page 127; 152pp; English.  
 XX  
 XX The invention relates to enzymatic nucleic acid molecules that down  
 CC regulate expression of chloride channel calcium activated 1 (CLCA1) genes  
 CC by cleaving RNA derived from the genes. The nucleic acid sequences are  
 CC useful as pharmaceutical agents for treating conditions such as chronic  
 CC obstructive pulmonary disease (COPD), chronic bronchitis, asthma, cystic  
 CC fibrosis, obstructive bowel syndrome and any other diseases or conditions  
 CC that are related to or will respond to the levels of CLCA1 in a cell or  
 CC tissue. The sequences are useful for reducing CLCA1 activity in a cell,

CC hence, are useful for treatment of a patient having a condition  
 CC associated with the level of C/CAI, where the invention further comprises  
 CC the use of one or more therapies under conditions suitable for the  
 CC treatment, for example, oxygen therapy, bronchodilators, corticosteroids,  
 CC antibacterials, vaccinations, acetylcysteine and mucokinetic agents. The  
 CC nucleic acids of the invention are also used as diagnostic tools to  
 CC examine genetic drift and mutations within diseased cells or to detect  
 CC the presence of C/CAI RNA in a cell. This sequence represents an  
 CC enzymatic nucleic acid molecule of the invention

```

XX The present invention relates to novel human zinc finger-containing  
CC proteins and their coding sequences: MD23, MD24, MD27, MD212. MD23 is  
CC encoded at chromosome 7q22.1. MD24 is encoded at chromosome 6p21.3-22.2,  
CC MD27 is encoded at chromosome 16p11.2 and MD212 is encoded at chromosome  
CC 15q26.1. The MD23, MD24, MD27, and MD212 sequences are useful in therapy,  
CC or in manufacturing a medicament for treating or preventing a disorder  
CC associated with decreased or increased expression or activity of MD23,  
CC MD24, MD27, or MD212, e.g. cancer or developmental disorders. The nucleic  
CC acids and proteins are also useful for diagnosing or monitoring a disease  
CC caused by altered expression of MD23, MD24, MD27, or MD212. The nucleic  
CC acids can also be used as probes to detect and characterize gross  
CC alterations in MD23, MD24, MD27, or MD212 genetic locus. The probes are  
CC useful in constructing microarrays for measuring gene expression. The  
CC proteins are useful as therapeutic agents for gene therapy or as  
CC vaccines. The present sequence was used to illustrate the invention.

XX CC The present invention relates to nucleic acid molecules which modulate
CC the synthesis, expression and/or stability of Hepatitis C virus (HCV) or
CC Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense
CC and enzymatic nucleic acids such as hammerhead ribozymes, DNazymes,
CC inozymes, zinzymes, ambezymes, and G-cleaver ribozymes. Also disclosed
CC are nucleic acid decoy molecules and aptamers that bind to HBV reverse
CC transcriptase and/or HBV reverse transcriptase primer sequences, as well
CC as oligonucleotides that specifically bind the Enhancer I region of HBV
CC DNA. The nucleic acids may be used to modulate the expression of HBV
CC genes and HBV viral replication. Also disclosed is a method for screening
CC compounds and/or potential therapies directed against HBV, and compounds
CC that modulate the expression and/or replication of HCV. The compounds and
CC methods of the invention are useful for the treatment of degenerative and
CC disease states related to HBV and HCV infection, replication and gene
CC expression such as cirrhosis, liver failure, and hepatocellular
CC carcinoma. The present sequence represents a substrate for one of the HCV
CC DNazyme or minus strand DNazyme sequences disclosed in the present
CC invention

 XX  
 CC The invention relates to the isolation of 6337 nucleotide sequences,  
 CC fragments of at least 15 consecutive nucleotides of these nucleotides, a  
 CC sequence having at least 80% identity, after optimal alignment, with the  
 CC nucleotides, a sequence that hybridizes under stringent conditions with  
 CC the nucleotides, or the complement, or corresponding RNA, of the  
 CC nucleotides. The nucleotides are used as probes or primers for detecting,  
 CC identifying, quantifying and/or amplifying nucleic acids, as in vitro

CC sense and antisense sequences, of nucleotides involved in tumour  
 CC suppression or reversion, apoptosis and or viral resistance, to produce  
 CC recombinant polypeptides, and to prepare transgenic animals, as  
 CC experimental models. The nucleotides (also vectors containing them and  
 CC cells containing the vectors), the encoded polypeptides and antibodies  
 CC (Ab) against the polypeptide are useful for prevention and/or treatment  
 CC of viral infections or diseases characterized by development of tumours  
 CC or cell degeneration (e.g. Alzheimer's disease or schizophrenia).  
 CC Analysis of the expression of the nucleotides can be used for diagnosis  
 CC and/or prognosis of these diseases. The nucleotides and polypeptides can  
 CC also be used to screen for their specific interactive molecules,  
 CC potentially useful for treating diseases associated with abnormal  
 CC expression of the nucleotides.

PT	Novel enzymatic nucleic acid that down-regulates expression of neurite growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or protein kinase PKR genes, for treating cancer and inflammatory disease.
PS	Claim 161; SEQ ID NO 5217; 317pp; English.
XX	
CC	The invention comprises nucleic acids (e.g. antisense oligonucleotides) that down regulate the expression or inhibit the function of a receptor for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR), IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the invention are useful for treating: cerebrovascular accident, central nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, tendinitis or asthma), Crohn's disease, diabetes, obesity, autoimmune ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The nucleic acids of the invention are also useful for down-regulating the expression of a target gene and as a diagnostic tool to examine genetic drifts and mutations within diseased cells or to detect the presence of a target RNA in a cell. The present RNA sequence represents a human PKR substrate sequence.

PS Example 1; Page 46; 67pp; English.  
 XX AAT28317-T28347 represent multi-G oligonucleotides. AAT28332-T28335 are  
 CC multi-G oligonucleotides with inosine substitutions. These sequences are  
 CC oligonucleotides of the invention. These sequences can be modified to  
 CC become more nuclease resistant, using phosphorothioate,  
 CC phosphorodithioate, or 3'-carbon modified links. To screen for modified  
 CC multi-G sequences that inhibit cell proliferation, cultured smooth muscle  
 CC cells that are arrested in the G0 phase, are induced to proliferate in  
 CC the presence of the multi-G sequence. The cultured smooth muscle cells  
 CC used in this method are attached to a solid support, and growth arrest is  
 CC achieved on a starvation medium, followed by transfer to a normal growth  
 CC medium to induce proliferation. The compounds that provide over 50%  
 CC inhibition at a set dosage are selected as being useful for inhibiting  
 CC vascular restenosis. The multi-G oligonucleotides are used to inhibit  
 CC proliferation of smooth muscle cells, such as to prevent arterial  
 CC restenosis. These sequences are not antisense sequences, but are thought  
 CC to work in a similar way. The sequences are thought to act by binding to  
 CC proteins involved in the proliferation process. Compounds containing  
 CC these multi-G oligonucleotides are not toxic, and their effect on cell  
 CC proliferation is fully reversible

 PT Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA  
 PT stability - useful for treating e.g. tumour angiogenesis, psoriasis,  
 PT rheumatoid arthritis, etc., in a human patient.

XX Claim 4; Page 187; 218pp; English.  
 PS  
 CC The present invention describes nucleic acid molecules which modulate the  
 CC synthesis, expression and/or stability of a mRNA encoding 1 or more  
 CC receptors of vascular endothelial growth factor (VEGF). A patient  
 CC (preferably human) having a condition associated with the level of the  
 CC fms-like tyrosine kinase 1 (flt-1), kinase insert domain containing  
 CC receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour  
 CC angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be  
 CC treated by administering the nucleic acid molecule or the expression  
 CC vector to the patient. AAX67275 to AAX75752 represent specific examples  
 CC of nucleic acid molecules from the present invention

 PT Identifying compounds which modulate expression of nucleic acids, used to  
 PT provide compounds having defined physical, chemical or bioactive  
 PT properties, e.g. antisense activity.  
 XX  
 PS Example 30; Page 114; 264pp; English.  
 XX  
 CC A method has been developed of defining a set of compounds that modulate  
 CC the expression of a target nucleic acid (tNA) sequence via binding of the  
 CC compounds with the tNA sequence. The method comprises generating a  
 CC library of virtual compounds in silico according to defined criteria, and  
 CC evaluating in silico the binding of the virtual compounds with the tNA  
 CC according to defined criteria. Also described are: (1) a method of  
 CC defining a set of oligonucleotides (ONs) that modulate the expression of  
 CC a tNA sequence via binding of the ONs with the tNA sequence comprising  
 CC generating a library of virtual compounds in silico according to defined  
 CC criteria, and evaluating in silico the binding of the virtual ONs with  
 CC the tNA according to defined criteria; and (2) a method of defining a set  
 CC of compounds that modulate the expression of a tNA sequence via binding  
 CC of the compounds with the tNA. The methods can be used for the generation  
 CC and identification of synthetic compounds having defined physical,  
 CC chemical or bioactive properties. Information gathered from assays of  
 CC such compounds is used to identify nucleic acid sequences that are  
 CC tractable to a variety of nucleotide sequence-based technologies, e.g.  
 CC antisense drug discovery and target validation. AA240852 to AA241220, and  
 CC AAV52701 to AAV52706, represent sequences used in the exemplification of  
 CC the present invention

PT Immortalized human hair papilla cells used for evaluation of hair growth  
PT agent - are prepared by transformation of human hair papilla cells with  
PT gene with deleted replication initiation point.

PS Example 2; Page 7; 23pp; Japanese.

CC The specification describes the preparation of immortalized human hair  
CC papilla cells (HPC). The method comprises transformation of HPC with an  
CC SV40 viral large T-antigen gene with deleted replication initiation  
CC point. The immortalized HPC can be used in a screening method for a hair  
CC growth agent, by culture of immortalized HPC in the presence of a  
CC substance to be tested and observation of the growth of the immortalized  
CC HPC. HPC is also used in development of hair growth stimulating agents.  
CC The present sequence represents a PCR primer, which is used in the course  
CC of the invention

 PT diagnosis.  
 XX  
 XX Claim 8; Page 78; 83pp; Japanese.  
 PS  
 CC The present invention describes a method for distinguishing a human  
 CC leukocyte antigen (HLA) class I antigen or allele by a combination of  
 CC polymerase chain reaction (PCR) using a primer pair whereby all HLA-A, -B  
 CC or -C alleles can be amplified or using reverse hybridisation analysis  
 CC comprising a DNA probe covalently bonded to microtitre plate wells which  
 CC are hybridisable specifically with the base sequence of at least one  
 CC specific HLA-A, -B or -C allele. The method is applicable in gene typing,  
 CC judging donor-recipient compatibility during organ transplant and  
 CC correlation analysis for diagnosis of various diseases. The method is  
 CC simple, rapid and accurate, with possibility of mechanisation and  
 CC automation, without the problems encountered by using the prior-art  
 CC techniques. AAA66943 to AAA67072 represent oligonucleotide probes and PCR  
 CC primers for use in the method of the present invention

 XX

CC PCR primers AA299443-49 were used to amplify a gibberellin 3beta-  
 CC hydroxylase cDNA fragment. The amplified sequence is used in the method  
 CC of the invention. The specification describes methods for the inhibition  
 CC and control of gibberellin acid levels. Gibberellin acid levels may be  
 CC inhibited or controlled by use of a chimeric expression construct  
 CC expressing a RNA or protein which suppresses the gibberellin biosynthetic  
 CC pathway sequence, diverts substrate from the pathway, or degrades pathway  
 CC substrates or products. The methods uses copaly] diphosphate synthase,  
 CC 3beta-hydroxylase, 2-oxidase, phytoene synthase, C-20 oxidase, and a  
 CC 3beta,3beta-hydroxylase polynucleotides to achieve this. The method is  
 CC used to control seed germination and seedling growth especially to  
 CC regulate gene products of gibberellin biosynthetic pathway and  
 CC restoration of normal seed germination, in transgenic plants. The plants  
 CC produced are gibberellin deficient, and have shortened hypocotyl and/or  
 CC epicotyl phenotypes compared to normal plants

 PT Novel antisense compounds for modulating the expression of Survivin and  
 PT treatment of cancer.  
 XX  
 PS Example 17; Page 58; 120pp; English.  
 XX  
 XX The invention relates to antisense oligonucleotides targeted to a nucleic  
 CC acid molecule encoding human Survivin, where the antisense  
 CC oligonucleotide inhibits the expression of human Survivin. These  
 CC antisense oligonucleotides are used in the treatment of an animal  
 CC suffering from a disease or condition associated with Survivin, e.g. a  
 CC hyperproliferative condition such as cancer, and comprises administering  
 CC a therapeutically or prophylactically effective amount of the antisense  
 CC oligonucleotide so that expression of Survivin is inhibited. The  
 CC oligonucleotides can also be used to treat a human suffering from a  
 CC disease or condition characterised by a reduction in apoptosis comprising  
 CC administering the antisense oligonucleotide to a human. In addition, the

CC antisense oligonucleotide and a cytotoxic chemotherapeutic agent e.g.  
CC taxol or cisplatin, can be used to modulate apoptosis, cytokinesis or the  
CC cell cycle, or inhibit the proliferation in a cancer cell by contacting  
CC the cell with the antisense oligonucleotide. AAS21521-AAS21768 represent  
CC Survivin nucleic acids, and antisense oligonucleotides targeted to  
CC Survivin, used in the method of the invention

XX PT Set of novel map-related biallelic markers, preferably located on obesity  
XX disorder-associated chromosomal regions on chromosomes 3, 10 and 19,  
XX useful, for e.g. detecting statistical correlations between marker allele  
XX and a phenotype.

XX PS Example 2; Page 228; 31pp; English.

XX CC The invention relates to a set of novel map-related biallelic markers,  
XX preferably located on obesity disorder-associated chromosomal regions on  
XX chromosomes 3, 10 and 19. The markers are useful for genotyping or  
XX estimating the frequency of an allele in a population, for detecting an  
XX association between a genotype or haplotype and a phenotype, e.g. a  
XX disease involving drug responses, obesity or disorders related to  
XX obesity, such as hyperuricaemia, digestive pathology, hepatic function  
XX disorders, cancer, cardiovascular disease, hypertension, hyperlipidaemia,  
XX insulin disorders, atheromatous disease and cardiac insufficiency. The  
XX markers are useful for detecting a statistical correlation between a  
XX biallelic marker allele and a phenotype and/or between a biallelic marker  
XX haplotype and a phenotype. This sequence represents a PCR primer used to  
XX amplify a human obesity-associated biallelic marker

XX PT Control of gibberellin levels in plants useful to avoid unfavorable  
XX conditions in crops to increase yields, using transgenic plants having  
XX reduced seed germination and early seedling growth then treatment to  
XX restore these properties.

XX PS Example 6; Page 83; 15pp; English.

XX CC The invention relates to control of gibberellin (GA) levels in plants.  
XX The method involves producing transgenic plants having a phenotype of  
XX reduced seed germination and reduced early seedling growth, then  
XX restoring seed germination and early seedling growth by treating plants  
XX with an appropriate compound when conditions are favourable. The method  
XX is useful to control seed germination and/or early seedling growth in  
XX agricultural production so that unfavorable environmental conditions  
XX normally reducing agronomic output can be avoided and yields increased.  
XX Plants also demonstrate increased uniformity of germination, emergence  
XX and seedling vigor, so increasing yields at harvest. The method is  
XX especially useful in crop plants such as e.g. canola, soybean, cotton,  
XX etc., and is also useful in storage and transport of seeds to reduce  
XX premature germination which may affect agronomic or food quality of the  
XX seeds. The present sequence is rapid amplification of cDNA ends (RACE)  
XX PCR primer used to amplify cotton gibberellin 3-beta hydroxylase cDNA.  
XX This primer is used in exemplification of the invention

DR New NOVX polypeptides and nucleic acids, useful for preventing or
XX treating NOVX-associated disorders, e.g. cancer, cardiomyopathy,
PT atherosclerosis, or diabetes, and in chromosome mapping, tissue typing or
PT pharmacogenomics.
XX
XX Example 19; Page 261; 332pp; English.
XX
XX The invention describes an isolated polypeptide (I) comprising any of 27
CC 118-961 residue amino acid sequences, given in the specification, a
CC mature form of them, a sequence that is at least 95 % identical to them,
CC or a sequence having one or more conservative substitutions in them. The
CC polypeptide is useful in manufacturing a medicament for treating a
CC syndrome associated with a human disease selected from a pathology
CC associated with the polypeptide. The NOVX polypeptides, polynucleotides
CC and antibodies are useful in treating or preventing NOVX-associated
CC disorders, e.g. cardiomyopathy, atherosclerosis, cancer, diabetes, immune
CC disorders, AIDS, obesity, asthma, haematopoietic disorders, Parkinson's
CC disease, Alzheimer's disease, infections, multiple sclerosis, cancer-
CC associated cachexia, and other wasting disorders associated with chronic
CC diseases. The nucleic acids and polypeptides may also be used as targets
CC for the identification of small molecules that modulate or inhibit e.g.
CC neurogenesis, cell differentiation, cell proliferation, haematopoiesis,
CC wound healing and angiogenesis, in gene therapy, in generation of
CC antibodies that bind immunospecifically to NOVX substances for use in
CC therapeutic or diagnostic methods. The nucleic acids are further used as
CC hybridisation probes, in chromosome mapping, tissue typing, preventive
CC medicine, and pharmacogenomics. The polypeptides are also useful as
CC vaccines. This sequence represents a primer used to isolate DNA encoding
CC novel human G-protein coupled receptor related NOV proteins

PT New polynucleotide comprising at least one first sequence element
PT inserted in a second sequence element, useful for preparing a composition
XX for treating cancer.
XX
XX Example 5; Page 27; 49pp; English.
XX
XX The present sequence is a reverse primer for the murine tumour necrosis
CC factor (MTNF) gene. In examples from the invention, MTNF was expressed in
CC bacterial host cells under the control of egla or recA promoters (see
CC ABZ58088-89) in which Cheo box (see ABZ58043) sequences had either been
CC inserted or deleted. These provided examples of methods of the invention
CC in which a promoter which is not inducible by DNA damaging agents or
CC conditions is converted into a promoter which is inducible by radiation,
CC element such as a Cheo box, or in which a repressor binding
CC sequence is used to increase the induction level, or to decrease the
CC basal expression level, of a promoter which is inducible by genotoxic
CC compounds or conditions. The novel expression system has wide industrial
CC applications in recombinant protein production, and clinical applications
CC including the controlled expression of therapeutic compounds such as MTNF
CC in hypoxic tissues such as tumours

XX
XX Selective immune downregulation against particular antigens of bacteria
XX or transplant materials - also for treating autoimmune disease, by oral
XX administration of antigen-containing material.
XX
XX Example 2; Page 39; 73pp; English.
XX
XX A method has been developed for producing selective immune down
XX regulation (SIDR) in a subject to an infectious bacterial agent. The
XX method comprises administering a combination of reagents that includes at
XX least one component, or fragment, of the infectious agent. The present
XX sequence represents a PCR primer for human bilirubin uridine-
XX diphosphoglucuronate glucuronosyltransferase-1 (BUGT-1) gene used in an
XX example from the present invention. SDR is established against
XX Streptococcus in cases of rheumatic fever or glomerular nephritis and the
XX transplant process is used to prevent guest vs. host disease. More
XX generally SIDR may be directed (1) against a gene delivery vector and/or
XX its expression product; (11) against a wide range of bacteria, viruses
XX and fungi (including human immune deficiency virus and hepatitis B and C
XX viruses) where the immune response is an important part of the disease

```

process; (iii) to induce immunological tolerance (in cases of autoimmune diseases) and (iv) for immune suppression, i.e. to modulate, specifically suppress any unwanted immune response. Establishing SDR allows a patient to retain immune competence against all but selected antigens, i.e. it avoids the risks associated with generalised immune suppression. When used in conjunction with gene therapy vectors, SDR lengthens the period of transient expression

XX Novel human forkhead activin signal transducer gene and polypeptides, used for screening for compounds which modulate the action of TGFbeta.

XX Example 2; Page 19; 47pp; English.

XX The present sequence is that of primer NT2-8 which was used in the PCR amplification of human PAST-1 (hPAST-1) sequences. The primer pair (see also AAZ58145) span an intron and thereby allow discrimination of MRNA-derived PCR products from those derived from genomic DNA or unprocessed RNA. The hPAST-1 gene (see Z581144) appeared to be expressed in all CC normal human tissues tested, including those of breast, colon, thymus and muscle, as well as in several cancer cell lines. hPAST-1 protein (see AAY5873) mediates transcriptional responses to tumour-derived growth factor-beta (TGF-beta) and activin in a ligand-, receptor- and Smad-dependent fashion. The invention includes tools for investigating the CC-beta signalling pathway and screening for compounds which modulate the CC action of TGF-beta. Such compounds can be used to modify or regulate CC transcriptional activation associated with the TGF-beta signalling CC pathway, and can be applied therapeutically to alter the growth of tumour cells, or to alter normal or abnormal developmental responses

```

CC This invention relates to human polynucleotide sequence AAF72333 which  
 CC encodes keratinocyte derived interferon (KDI) protein AAB49774, which is  
 CC a member of the interferon family. AAF72338 represents the codon  
 CC optimized sequence of KDI. The human KDI gene is located on chromosome 9.  
 CC The specification includes KDI related protein sequences AAB49775 -  
 CC AAB49789. Also given in the specification are primer, probe and  
 CC polynucleotide sequences represented by AAF72334-AAF72370 (excluding  
 CC AAF72338) which are used in the isolation and characterization of the KDI  
 CC sequence of the invention. The KDI polypeptide is used to treat viral  
 CC infections and the protein and polynucleotide may be used to prevent,  
 CC treat or ameliorate a medical condition such as immune system-related  
 CC disorder, viral infection, viral exposure and cancer in a mammal.  
 CC Specific disorders which can be treated by KDI include multiple  
 CC sclerosis, lymphoma, acquired immune deficiency syndrome, viral  
 CC hepatitis, cryptosporidium parvum infection, chronic myelogenous  
 CC leukaemia, arthritis, diabetes and allergies

 PT clinical diagnosis and detecting food contamination, comprises 23S and 5S  
 PT rDNA sequences.  
 XX  
 PS Example 5; Page 27; 140pp; German.  
 CC  
 CC This invention describes a novel nucleic acid molecule (I), useful as a  
 CC probe and/or primer for detecting bacteria. The invention also describes  
 CC (1) a combination of at least two nucleic acids (II) for detecting  
 CC bacteria or phylogenetic groups of bacteria, particularly enterobacteria;  
 CC (2) a kit containing (I) or the combination of (II); (3) detecting  
 CC bacteria (particularly enterobacteria) in a sample by contacting the  
 CC sample with (I) or the combination of (II) and detecting hybridization;  
 CC and (4) amplifying (MI) bacterial DNA from many different taxonomic  
 CC groups using (I) or the combination of (II) as primers. The method is  
 CC used to detect and identify bacteria, for clinical diagnosis and for

CC detecting contamination of food. (II) can detect bacteria at various  
 CC levels of selectivity (e.g., all bacteria, particular classes, families,  
 CC genera or species). The method exploits the fact that the 23S and 5S rDNA  
 CC regions, and the intermediate transcribed spacer, contain some sequences  
 CC that are highly conserved and others that are highly variable. AAH49807-  
 CC AAH50411 represent primers used to illustrate the method of the invention

 XX  
 PS Example 1; Page 309; 408pp; English.  
 CC  
 CC The present invention describes a method for treating a proliferative  
 CC skin or eye disease and scarring. The method involves administering a  
 CC ribozyme (I) which cleaves RNA encoding a cytokine involved in  
 CC inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle  
 CC dependent kinase, growth factor or a reductase, or administering a  
 CC nucleic acid molecule (II) comprising a promoter operably linked to a  
 CC nucleic acid segment encoding (I). (I) can have antipsoriatic,  
 CC dermatological, cytosclatic, antiseborrheic, antidiabetic, antitickling,  
 CC ophthalmological, vulnery, keratolytic and vitruclide activities, and  
 CC cleaves RNA encoding cytokine involved in inflammation. (I) can be used  
 CC in gene therapy. (I) and (II) are useful for treating proliferative skin

CC diseases such as psoriasis, atopic dermatitis, actinic keratosis,  
 CC squamous or basal cell carcinoma and viral or seborrheic wart. They can  
 CC also be used for treating proliferative eye diseases such as diabetic  
 CC retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of  
 CC prematurity and retinal detachment, and for treating and preventing  
 CC scarring such as keloid, adhesion and hypertrophic or hypertrophic burn  
 CC scar. AAH57577 to AAH62099 represent sequences used in the

 PT Selectively recovering heterohybrid DNA from a reannealed mixture of two  
 PT DNA samples, useful for screening complex DNA samples, involves  
 PT methylating both strands of a first sample.  
 XX  
 PS Disclosure; Col 15; 16pp; English.  
 XX  
 CC The present invention relates to a method of selectively recovering  
 CC heterohybrid DNA from a reannealed mixture of two DNA samples. The method  
 CC comprises methylating both strands of the first sample but not the second  
 CC sample with DAM methylase, and methylating both samples with methylase  
 CC that protects all restriction sites recognised and cleaved by a  
 CC restriction enzyme against cleavage. The heterohybrid DNA has one strand  
 CC derived from a second sample. The method involves the use of Y-shaped  
 CC adapters having a region of non-complementary single-stranded DNA at the  
 CC ends. The method can also be used for homohybrid DNA containing DNA  
 CC strands from the same sample. The method is useful for selectively  
 CC recovering heterohybrid and homohybrid DNA from a reannealed mixture of  
 CC two DNA samples. The method is useful for screening complex DNA  
 CC preparations and for isolation of genes without requiring prior knowledge  
 CC of their biochemical function or map position. The present sequence  
 CC represents a human DNA sequence of unknown function. Note: The present

CC sequence is given as Seq ID No. 6 in the sequence listing but is not  
CC mentioned elsewhere in the specification

XX Novel polynucleotide of the endothelin/endothelin converting

XX enzyme/receptors of endothelin and endothelin converting enzyme signaling

XX system associated with cardiovascular disease, useful for treating the

XX disease.

XX Example 6; Page 51; 190pp; English.

XX The invention describes a polynucleotide (I) of the endothelin

XX (EDN)/endothelin converting enzyme (ECE)/receptors of EDN and ECE (EDNR)

XX signaling system which is associated with a cardiovascular disease. (I),

XX the gene encoding EDN, ECE or EDNR (II) or a vector (III) expressing (I)

XX or (II) is useful for producing cells capable of expressing a molecular

XX variant polypeptide which is associated with a cardiovascular disease.

XX (II), (III), the EDN, ECE or EDNR polypeptide, or a cell expressing a

XX molecular variant gene comprising (I) is useful for identifying and

XX obtaining a pro-drug or drug capable of modulating the activity of a

XX molecular variant of a polypeptide of the EDN/EDNR/ECE signaling system

XX or its gene product, or for identifying and obtaining an inhibitor of the

XX activity of a molecular variant of a polypeptide of the EDN/EDNR/ECE

XX signaling system or its gene product. The isolated proteins and

XX polynucleotides encoding them are useful for preparation of a

XX pharmaceutical composition for treating a cardiovascular disease such as

XX coronary heart disease, hypertension, atherosclerosis, or related to

XX abnormal angiogenesis or fatty acid metabolism e.g. diabetes and familial

XX hypercholesterolemia. The gene or a polynucleotide fragment of the

XX EBN/ECE/EDNR signaling system are useful as forensic markers, for

CC creating a transgenic animal and in creation of a solid support

CC comprising polynucleotides, genes, vectors, polypeptides, antibodies or

CC host cells of the invention. This sequence represents a PCR primer used

CC to isolate a cardiovascular regulator polynucleotide from DNA encoding

CC members of the EDN/ECE/EDNR signaling pathway

XX WPI; 2003-227870/22.

XX New isolated antibody that binds a keratinocyte derived interferon (KDI)

XX protein, for the diagnosis, prevention and treatment of disorders with

XX aberrant expression of the KDI protein, such as disorders of the immune

XX system.

XX Example 5; Col 166; 147pp; English.

XX The present invention relates to the isolation of human keratinocyte

XX derived interferon (KDI) protein, and the polynucleotide sequences

XX encoding it. The gene encoding human KDI maps to chromosome 9. The novel

XX KDI protein is a member of the interferon family. The invention also

XX describes vectors, host cells, and recombinant methods for producing the

XX KDI protein. The invention also discloses methods for identifying

XX agonists and antagonists of KDI activity. An antibody that binds to the

XX KDI protein, the KDI polypeptide sequence, and the polynucleotide

CC sequence encoding KDI are useful in the diagnosis, prevention and  
CC treatment of disorders associated with the aberrant expression of the KDI  
CC protein, such as disorders of the immune system, inflammation, cancer,  
CC blood disorders, cardiovascular disorders, cerebrovascular diseases,  
CC wounds, neurological diseases, bacterial or viral infections and blood  
CC vessel growth inhibition. The present sequence represents a PCR primer  
CC used in a quantitative PCR (QPCR) reaction in the examples of the present  
CC invention

 XX  
 CC This invention relates to novel short interfering nucleic acid (siNA)  
 CC molecules that downregulate expression of a protein tyrosine phosphatase-  
 CC 1B (PTP-1B) gene by RNA interference (RNAi). Specifically, the siNAs can  
 CC be short interfering RNA (siRNA), double-stranded RNA (dsRNA), micro-RNA  
 CC (miRNA) or short hairpin RNA (shRNA), all of which can mediate inhibition  
 CC of PTP-1B. The present invention describes sequence-specific post-  
 CC transcriptional gene silencing in animals using siNA molecules and  
 CC antisense oligonucleotides to modulate PTP-1B gene expression or  
 CC activity. Furthermore, these siNA molecules provide useful reagents for a  
 CC variety of therapeutic and diagnostic purposes, and as such can be used  
 CC for treating obesity, insulin resistance or diabetes (types I and II), as  
 CC well as for drug screening, target identification and validation, genetic  
 CC engineering, pharmacogenomics and for studying gene function and gene  
 CC mapping (for example of single-nucleotide polymorphisms). Accordingly,  
 CC these molecules exhibit anorectic and antidiabetic activities. This  
 CC oligonucleotide sequence is a sense siNA molecule that targets human PTP-  
 CC 1B RNA of the invention.

PT New short interfering nucleic acids, useful e.g. for treatment and
PT diagnosis of Alzheimer's disease, which down regulates expression of the
PT beta-secretase gene.
XX
XX
PS Example 3; SEQ ID NO 619; 144bp; English.
XX
XX The invention relates to short interfering nucleic acids (siNA) which
CC downregulate expression of the human beta-secretase (BACE) gene by RNA
CC interference. The siNAs may or may not comprise ribonucleotides and may
CC be double or single stranded. They further comprise sense and antisense
CC regions, or alternatively are assembled from a sense oligonucleotide and
CC an antisense oligonucleotide. Specifically, the siNAs include short
CC interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short
CC hairpin RNA (shRNA). The siNAs can be unmodified or chemically modified,
CC can contain deoxyribonucleotides, and can be chemically synthesised.
CC The invention also comprises a vector or enzymatically synthesised. The invention also
CC relates to kits for the in vitro or in vivo delivery of siNA; conjugates
CC and/or complexes of siNA; and vectors that express siNA. The siNAs are
CC used to modulate expression of the BACE gene in cells, tissue explants or
CC organisms (e.g., by ex vivo gene therapy), or in grafts and transplants
CC for the treatment of a variety of conditions. They may be used for
CC treating Alzheimer's disease or other degenerative conditions such as
CC dementia and stroke/cardiovascular accident. The siNAs are also useful
CC for drug screening, diagnosis, therapeutic target identification and
CC validation, genetic engineering, pharmacogenomics, studying gene
CC function, and gene mapping (e.g., of single nucleotide polymorphisms).
CC The present sequence represents the lower strand of a human BACE-targeted
CC double-stranded siNA.

XX
XX Determining whether a subject has or is at risk of developing a disease
XX characterized by bronchial hyperresponsiveness, comprises determining the
XX expression or bioactivity level of an asthma-associated gene.
XX
XX Example 3; Page 27; 70pp; English.
XX
XX The invention discloses a method for determining a disease (e.g asthma)
XX characterised by bronchial hyperresponsiveness, or the risk of developing
XX it and a way of obstructing or chronic bronchial inflammation. Asthma is a
XX multifactorial disease, so discovery of the asthma susceptibility genes
XX can identify the fundamental mechanisms behind asthma. One such gene is
XX the asthma-associated gene, AAGA. Also disclosed is an allele-specific
XX primer or oligonucleotide probe capable of detecting a polymorphism, an
XX AAGA associated with bronchial hyperresponsiveness and methods for
XX pharmacogenomically selecting a therapy to be administered to an
XX individual having asthma, comprising determining an AAGA genetic profile
XX and comparing the individual's genetic profile to an AAGA genetic
XX population profile, monitoring the effectiveness of treatment (e.g. gene
XX therapy or antisense gene therapy) of a subject and identifying a
XX substance which binds to or modulates the activity of AAGA. The
XX polynucleotide, polypeptide encoded by it, antibody to the polypeptide,
XX or an oligonucleotide, is useful for preparing a medicament for treating
XX a disease characterised by bronchial hyperresponsiveness, or inflammatory
XX or obstructive airways diseases, e.g. adult distress respiratory
XX syndrome, chronic obstructive pulmonary, chronic bronchitis or dyspnea.
XX The method is useful for prognosis, diagnosing or confirming that a
XX symptomatic subject has a genetic defect which causes or contributes to
XX the particular disease or disorder, for ascertaining an individual's
XX predilection to develop bronchial responsiveness and for customising a
XX therapy for the individual according to the individual's genetic profile.
XX The sequences presented in ABX98968-ABX99053 and ABX99064-ABX99066 are
XX PCR primers which were used to amplify sequences used in human AAGA
XX vector construction and primers used to analyse AAGA single nucleotide
XX polymorphisms (SNPs)

XX
XX New small interfering polynucleotide that modulates protein tyrosine
XX phosphatase (PTP)1B polypeptide signal transduction, useful for treating
XX disorders associated with altered PTP1B signal transduction, e.g.
XX diabetes or cancer.
XX
XX Example 3; SEQ ID NO 263; 234pp; English.
XX
XX The invention relates to a novel isolated small interfering RNA (siRNA)
XX polynucleotide, comprising at least one nucleotide sequence from any of
XX the 20 fully defined sequences given in the specification. The invention
XX further relates to: a pharmaceutical composition comprising a new siRNA
XX polynucleotide and a physiological carrier; a recombinant nucleic acid
XX construct, comprising a polynucleotide that is capable of directing
XX transcription of an siRNA; a host cell transformed or transfected with
XX the above recombinant nucleic acid construct; a method for interfering
XX with expression of a protein tyrosine phosphatase (PTP)1B polypeptide, or
XX its variant; a method for identifying a component of a PTP1B signal
XX transduction pathway; a method for modulating an insulin receptor protein
XX phosphorylation state in a cell; a method for altering a Jak2 protein
XX associated disorder. The siRNA has the following activities:
XX anti-diabetic, anorectic, antiinflammatory, neuroprotective, cytostatic,
XX immunosuppressive, and antimicrobial. The novel siRNA polynucleotides can
XX be used in gene therapy to treat disorders. The composition and methods
XX are useful in treating disorders associated with PTP1B-mediated signal
XX transduction, such as diabetes, obesity, hyperglycemia-induced
XX apoptosis, inflammation, neurodegenerative disorders, cancer, autoimmune
XX diseases or infection. This polynucleotide sequence represents an siRNA
XX used for modulating the signal transduction of a protein tyrosine
XX phosphatase of the invention.

 XX  
 XX New small interfering polynucleotide that modulates protein tyrosine  
 PT phosphatase (PTP)1B polypeptide signal transduction, useful for treating  
 PT disorders associated with altered PTP1B signal transduction, e.g.  
 PT diabetes or cancer.  
 XX  
 XX Example 3; SEQ ID NO 187; 234pp; English.  
 PS  
 XX The invention relates to a novel isolated small interfering RNA (siRNA)  
 CC polynucleotide, comprising at least one nucleotide sequence from any of  
 CC the 20 fully defined sequences given in the specification. The invention  
 CC further relates to: a pharmaceutical composition comprising a new siRNA  
 CC polynucleotide and a physiological carrier; a recombinant nucleic acid  
 CC construct, comprising a polynucleotide that is capable of directing  
 CC transduction of an siRNA; a host cell transformed or transfected with  
 CC the above recombinant nucleic acid construct; a method for interfering  
 CC with expression of a protein tyrosine phosphatase (PTP)1B polypeptide, or  
 CC its variant; a method for identifying a component of a PTP1B signal  
 CC transduction pathway; a method for modulating an insulin receptor protein  
 CC phosphorylation state in a cell; and a method for altering a Jak2-protein  
 CC phosphorylation state in a cell; and a method for treating a Jak2-  
 CC associated disorder. The siRNA has the following activities:  
 CC antidiabetic, anorectic, antiinflammatory, neuroprotective, cytostatic,  
 CC immunosuppressive, and antimicrobial. The novel siRNA polynucleotides can  
 CC be used in gene therapy to treat disorders. The composition and methods  
 CC are useful in treating disorders associated with PTP1B-mediated signal  
 CC transduction, such as diabetes, obesity, hyperglycaemia-induced  
 CC apoptosis, inflammation, neurodegenerative disorders, cancer, autoimmune  
 CC diseases or infection. This polynucleotide sequence represents an siRNA  
 CC used for modulating the signal transduction of a protein tyrosine  
 CC phosphatase of the invention.

 PS  
 XX This invention relates to a novel Synovial membrane cell-originated  
 CC oxidase NOX1-b protein expressed specifically in patients with rheumatoid  
 CC arthritis. The invention may be useful for the development of compounds  
 CC with an antirheumatic or antiarthritic activity. The enzyme and the gene  
 CC which encodes it may be useful in diagnosis of rheumatoid arthritis and  
 CC in screening inhibitors as drugs for compositions in treatment of  
 CC rheumatoid arthritis and arthritis deformans. The present sequence is  
 CC that of an RT-PCR primer which was used during the exemplification of the  
 CC invention.

Interference RNA agent useful for treating dyslipidemia, coronary artery disease, diabetes, cancer or neurological disease, comprises sense sequence and antisense sequence which has specific modifications.

Example 5; SEQ ID NO 6353; 378bp; English.

XX The invention describes a RNA interference (iRNA) agent (I) comprising a sense sequence and an antisense sequence, where the sense sequences have one or more asymmetrical 2'-O alkyl modifications, the antisense sequences have one or more asymmetrical phosphorothioate modifications and the antisense sequence targets a human gene sequence. Also described are: a pharmaceutical preparation comprising (I); reducing (M) apob-100 levels or glucose-6-phosphatase levels in a subject; producing (I); introducing one or more asymmetrical modification in the sequence, where the modification decreases nuclease sensitivity while not decreasing its activity; a kit comprising (I) and instruction for its use; and a device that can be dispense or administer a composition comprising (I). (I) is useful for reducing apob-100 levels or glucose-6-phosphatase levels. (M) is useful for reducing apob-100 levels or glucose-6-phosphatase levels. CC The subject is suffering from a disorder characterised by elevated or otherwise unwanted expression of apob-100, elevated or otherwise unwanted levels of cholesterol, and/or dysregulation of lipid metabolism. The disorder is chosen from the HDL/LDL cholesterol imbalance, dyslipidaemias, hypercholesterolaemia, statin-resistant hypercholesterolaemia, coronary artery disease (CAD), coronary heart disease (CHD) and atherosclerosis. (I) is administered to a subject to inhibit hepatic glucose production or for treating glucose-metabolism-related disorder e.g. diabetes or type-2 diabetes. (I) is useful for treating the diseases as mentioned above, cancer (e.g. breast, colon or lung cancer), neurological disease (e.g., Huntington disease or spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence represents a hepatitis C virus (HCV) antisense oligonucleotide that can be used to control HCV gene expression.
